

Surgical robotics today

Who are all these companies &
How did they get here?

Dwight Meglan

July 2026 Update · The commercial surgical robotics landscape
Companion to the Surgical AI Overview (July 2026)

All information discussed is derived from publicly available sources

Why me for this subject?

30+ years building surgical robots and simulators, and tracking everyone else's

- **Left Mayo tenure track 30+ years ago to stay an engineer**

Building surgical simulators since 1994; surgical robots since 2000

- **Part of many investment & acquisition diligence efforts**

Surgical robotics and adjacent: robotic systems, components and enablers; advanced visualization; machine learning

- **20+ years tracking commercial robots & simulators**

I work at the system level, from idea to prototype

15 COMMERCIAL SURGICAL ROBOTS

Involvement across specialties:

- 4 Abdominal / thoracic
- 4 Endovascular
- 3 Endoluminal
- 2 Cardiac
- 1 Ophthalmic
- 1 Vascular access

Why am I doing this?

A hobby that turned out to be useful, everything is a remix

- **I started collecting this information as a hobby**

Knowing how similarly focused robots could have diverse solutions was useful for my design work (everything is a remix)

- **As the collection grew, others might find it useful**

This deck is an overview of the field touching on the diversity of solutions for similar needs, e.g. surgeon consoles

- **I do deep dives for my own startup work and consulting**

NOTE

This talk is largely mechanics focused, but I typically work at the system level

- I work at the idea-to-prototype phase, i.e. typically much earlier than Steve Bell :-)

This talk...

A scope contract: breadth over depth, commercial over academic

IS

- A quick run through the breadth of commercial efforts
- An update on what has changed in the past ~6 months
- Examples of how this information provides insight
- Robots that act upon the body in some manner
- A broad view of 'commercial', even patents alone

IS NOT

- By any means exhaustive
- Delving into the myriad academic efforts
- Covering rehabilitation or assistive robots

Surgical robotics today: update notes, July 2026

What changed since the January 2026 edition

- **44 additions since January**

Roster now 759 robots / 663 companies: 7 orthopedic, 5 percutaneous, 5 endovascular, 4 abdominal/thoracic, 3 dental... 30 of the 44 are Chinese, mostly EPO patent-scan finds, not press

- **Full roster re-verification, 1-2 July**

532 field corrections, 121 new milestones, duplicates merged; quietly-approved systems re-checked, On Market count: 86 in January → 238 now

- **Funding data added for every robot**

Stage, total raised, lead investors, valuation and most-recent-milestone columns now populated throughout

ALSO NEW IN THIS EDITION

- Funding & investor data throughout
- 2026 flameouts & exits section
- Founding-year (vs first-evidence) view
- All charts regenerated from the master roster
- Live companion dashboard, see the end of the deck

Big picture on surgical robotics

Note: most stats reflect robots, not robot companies: the roster is one row per robot

Surgical robotics is a busy place

316 review articles in 2020–2022 per the refreshed counts; a sampling of 2022 titles below

HISTORY & OVERVIEWS

A short history of robotic surgery · Past, present and future of surgical robotics · An introductory review of robotically assisted surgical systems

IMAGING & GUIDANCE

Image-Guided Interventional Robotics: Lost in Translation? · Robot-Assisted Medical Imaging: A Review · MRI-Guided Robot-Assisted Surgery and Interventions

SPECIALTY-SPECIFIC

Robotics in neurosurgery · Intraocular Robotic Surgical Systems · Robot-assisted techniques in vascular and endovascular surgery · Robotic Systems in Radiotherapy

EMERGING TECH

Magnetically Actuated Medical Robots · Surgical Robotics in the Data Age · among others published in 2022

Surgical robotics is a busy place

Review articles per year, Google Scholar, refreshed 7 Jul 2026; 2026 = first half, actual

1,423 REVIEWS

cumulative since 2001

273 in 2025; 159 in H1 2026,
annualizing to roughly 318

**Same Google Scholar query
as prior editions; counts
refreshed 7 Jul 2026**

Where it came from

J Troccaz et al., Frontiers of Medical Robotics, Annu. Rev. Biomed. Eng. 21:193-218, 2019

J Troccaz et al., Frontiers of Medical Robotics: From Concept to Systems to Clinical Translation

Where it came from

knowablemagazine.org, Handing the surgeon's scalpel to a robot (2022)

Timeline of progress in surgical robots

- 1970s** NASA explores telesurgery.
-  **1983** First robot in the surgical suite, used to move patient's limbs into position during orthopedic surgery.
- 1985** First instance of a surgical robot, used during brain biopsy to avoid errors from hand tremors.
-  **1985** First laparoscopic procedure.
- 1990s** Laparoscopic surgery becomes more common, many novel procedures carried out and many new systems invented.
- 1991** First telepresence system, means surgeons don't need to be directly next to patient.
-  **1992** First robot with task autonomy gets FDA approval. Used in hip replacement, ROBODOC can carry out certain pre-programmed tasks autonomously once initiated by a human.
- 2000s** Surgical robots for general use become more common.
-  **2000** Introduction of da Vinci, the first robotic system for general and laparoscopic surgery in humans.
- 2001** Doctors in New York City use telesurgery to operate on a patient in France.
-  **2001** First robot with conditional autonomy gets FDA approval. Used in radiation therapy, CyberKnife can perform procedure autonomously.
- 2001 – present** Refinement of existing surgical robots continues to expand, robots become smaller, lighter, easier to use, and offer more assistance features for surgeons.
- 2009** Steerable catheters to access and operate constrained regions not reachable with rigid laparoscopy.
- 2022** STAR robot successfully sutures severed pig intestine.
- The future** Surgical robots gradually acquire increasing autonomy.

Commercial milestones

T Ginoya et al., A Historical Review of Medical Robotic Platforms, J. Robotics 2021

FIGURE 1: Decade I: timeline of robotic systems that founded and created the base for usage of robots in the medical field.

FIGURE 2: Decade II–timeline of robotic systems that signify the progress of the development curve of Robots in medical application.

FIGURE 3: Decade III–timeline of robotic systems that show the recent advancement in the field of medical robots based on the advancement of technology and effort of three decades of research in this field.

T Ginoya et al., A Historical Review of Medical Robotic Platforms
Journal of Robotics Volume 2021, Article ID 6640031,
13 pages <https://doi.org/10.1155/2021/6640031>

Commercial surgical robotics trends

Five parts: the roster today · how fast it grew · where · specialty waves · the endovascular case.
Stats reflect robots, not companies.

Lots of bots, mostly on the way

Roster · the field at a glance; there are more: stealth and non-US companies evade detection

STATUS OF THE 759 ROBOTS

■ On Market (238) ■ Under Dev (372) ■ Acquired (45) ■ Dead (65) ■ Uncertain (39)

On Market re-verified against regulator databases & company disclosures. Rows are robots; companies counted once across multi-robot portfolios.

Multi-robot portfolios are mostly recent

Roster · sources: patent filings, FDA/NMPA submissions, press releases, papers; collected 8-11 Jul 2026

66 MULTI-ROBOT COMPANIES

10% of tracked companies field two or more robots

Dated by first public evidence for each second robot: patent filing, FDA/NMPA submission, press release, or paper

56% went multi-robot in 2021 or later; earlier edition tallies (26, 28) lagged detection

How they work

Roster · control philosophy across all 759 robots; teleoperation still dominates

CONTROL MODE OF THE 759 ROBOTS

■ Teleoperation (481) ■ Preplanned (174) ■ Autonomous (79) ■ Handheld / manual / cooperative (25)

Autonomous roughly doubled since January (37→79), partly reclassification during re-verification, partly a real trend.

Focus is still predominantly in abdominal procedures

Roster · 759 robots by focus area, colored by status

141 ABDOMINAL / THORACIC
Orthopedic (88) and neuro (63) follow
A long tail of 32 focus areas
New categories since January: airway, regional anesthesia, trauma, podiatry, arm supplier

Company formation inflected around 2010

Growth · companies first seen per year, with the cumulative total

663 COMPANIES

Fewer than 3 per year before 2010

About 40 per year since 2015

2024-26 look low only because companies take 2-4 years to become detectable

2026 shows a bump because of improved detection which affects first year of detection

By founding year, the field is younger than it looks

Growth · companies by founding year; the Founded column is populated for 566 of 663 companies

DETECTION LAG

Companies typically surface 2-4 years after founding

First signals are patents and first raises, which lag incorporation

Expect the 2023-2026 bars to keep growing in future editions

The commercial wave is bigger than it looked

Growth · re-verifying every company tripled the on-market count; China's approvals were undercounted

86 → 238 ON MARKET

What changed

Jul 1-2 re-verification checked every row against NMPA/FDA/CE records and company disclosures

Many Chinese systems had approvals & installs that never made English-language press

Dead (48→65) and Uncertain (16→39) also grew, attrition was undercounted too

China surpassed the US in total surgical robots

Geography · cumulative robots by year first seen, China 243 vs US 208 today

243 vs 208

China vs US robots

There is detection lag in the US/China counts

Company-level counts mirror this crossover; detection lag on Chinese companies means the true gap is likely wider

Robots by country of origin

Geography · each circle is a country, area proportional to robots tracked

36 COUNTRIES

US + China = 59% of all robots

France (49), Korea (37), Germany (28) lead the tail

China's share of new robots by era: 13% through 2014, 40% in 2015-19, 44% since 2020

Global specialty robots development start

Specialty waves · Tufte-style period matrix; dot size = robots first seen in that period

Read across a row to see when each specialty became active; read down a column to see what each era produced.

China and US robots begun by specialty

Specialty waves · side-by-side period matrices; dot size = robots first seen

The US spreads across specialties and decades; China concentrates hard in 2015-2026, especially abd/thor, endovascular, percutaneous and orthopedic.

One specialty breaks the pattern

Endovascular case · cumulative robots by specialty; one curve does not fit the pattern

57 ENDOVASCULAR ROBOTS

Roughly 3/4 began after 2015

The steepest specialty curve of the last decade

China drives the spike; next slide

China accounts for the majority of the endovascular increase

Endovascular case · attribution in two views: who is building them, and China's specialty mix

CHINA'S WAVE

Endovascular was a US and EU niche until about 2015

China's curve bends sharply upward from 2018

Within China, endovascular is among the steepest specialty curves

US: abdominal/thoracic wave, steady orthopedic growth

Endovascular case · the US contrast: cumulative US robots by specialty

US PATTERN

Abdominal/thoracic keeps compounding despite the da Vinci incumbency

Orthopedic growth has been steady

Endovascular stays a modest US category, the contrast with China is the story

Commercial surgical robotics patent trends

Four questions: how much and where · what the filings cover · who holds it · how much is genuinely new

Overall surgical robotics patent applications: US & China

Cumulative published applications, A61B34/30 incl. subgroups, like-for-like basis, refreshed 7 Jul 2026

23,568 vs 15,271

China vs US cumulative applications

China's annual output passed the US in 2018; the cumulative stock crossed in 2022

Earlier editions mixed counting bases and overstated the gap; like-for-like it is ~2.5x and widening

Source: Google Patents result counts, q=(A61B34/30) country:US/CN, applications only, by publication year; collected 7 Jul 2026

US & China patents: normalized year-on-year change

$(\text{Year}[n] - \text{Year}[n-1]) / \text{peak year, normalized to each country's maximum}$

CHINA'S MOMENTUM

China's filing rate grew faster than the US rate in most years since 2010

Both countries decelerate after their peaks: China 2022, US 2024

2023-2025 values are understated by the ~18-month publication lag; treat recent bars as provisional

Source: Google Patents counts, same query as the previous slide

Normalization anchors: US peak 1,595 published applications (2024); China peak 3,980 (2022). 2026 excluded (partial year).

What the filings cover: US and China by CPC subgroup

Cumulative published applications by CPC subgroup; both panels share the same vertical scale. Source: Google Patents result counts, $q=(A61B34/3x)$, applications only, by publication year; collected 7 Jul 2026

SAME CATEGORIES, DIFFERENT SCALE

All surgical robots (34/30 incl. subgroups), master-slave, telesurgery, autonomous

China's curves accelerate the most after 2018

Source: Google Patents result counts, $q=(A61B34/3x)$ with country and status filters, by publication year; collected 7 Jul 2026; 2026 is first-half only

For IP, you need to count all the parts

Patent families by holder, subsidiaries stacked separately. Source: Google Patents result counts, TI/AB/CL=(surg* NEAR/3 robot*) per assignee, family-deduplicated; collected 12 Jul 2026

While there have been many patents published...

Publications (grants + applications, all offices) for the largest holders. Source: Google Patents result counts, per-publication mode; collected 12 Jul 2026

RAW VOLUME

JNJ group (Ethicon + Auris + Verb): 5,097 publications; Intuitive alone: 2,996

Publication counts include every office and every continuation

Volume alone overstates novelty, next slide
Source: Google Patents, collected 12 Jul 2026

...many are extensions of existing IP

Distinct patent families vs total publications, same query. Source: Google Patents result counts, family-deduplicated vs per-publication; collected 12 Jul 2026

FAMILY-LEVEL VIEW

Families run 2.5x to 6x below publication counts (Stryker 6.1x, CMR 5.3x, Intuitive 2.4x)

JNJ group: 1,737 families across Ethicon, Auris, and Verb

For diligence, count families and claims, not publications

Source: Google Patents, collected 12 Jul 2026

Examples of surgical robots in different specialties

Pictures shown not remotely comprehensive: intentionally chosen to provide historical perspective
Note that DEAD classification refers to the robot, not necessarily the company

Exits concentrate in a few repeat buyers

Acquisitions per buyer with targets and deal years; single-deal buyers aggregated. Sources: deal press releases and SEC filings; collected 8 Jul 2026

45 RESEARCHED DEALS

9 repeat buyers account for 25 of 45 acquisitions

Busiest: JNJ, Stryker, Intuitive, Kyniska

Repeat buying concentrates in orthopedics/spine and soft tissue

Acquisition typically takes about a decade

Age at acquisition vs deal year. Sources: press releases and SEC filings; current as of 8 Jul 2026

MEDIAN AGE AT EXIT: 9 YEARS

45 acquisitions with researched terms, 2003 to 2026

Disclosed prices span \$5M to \$3.4B; billion-dollar deals labeled

Gray dots: undisclosed price. Asset deals and mergers carry * in the table

Exit economics: the full record (1 of 2)

Raise-to-exit economics, UD = undisclosed, * = special aspects; maintained in the deck data file; current as of 8 Jul 2026

WHAT THE RECORD SHOWS

24 of 45 deals disclose a price; median \$79M

4 deals of \$1B+ sit atop a long tail: most exits are under \$100M

20 undisclosed deals cluster in the early years and small tuck-ins

7 asset-level deals (SurgiBot, AutoLap, REMI, Sculptura) show IP outliving its company

Spine and orthopedics account for the largest share of exits

UD = undisclosed · * = special aspects (see data file) · IPO = initial public offering · CVR = contingent value right

Exit economics: the full record (2 of 2)

Raise-to-exit economics, UD = undisclosed, * = special aspects; maintained in the deck data file; current as of 8 Jul 2026

Special Purpose Acquisition Corporations (SPACs)

The SPAC cohort, and how it went: Memic SPAC failed, re-emerged as Momentis; Vicarious delisted Mar 2026, board dissolution vote set

debut on Wall Street on Monday. The company closed its previously announced business combination with D8 Holdings Corp. last week, gathering \$220 million in gross proceeds. The deal, announced this past April, valued the combined company at an enterprise value of approximately \$1.1 billion.

Israel medical device company **Memic Innovative Surgery Ltd.** today announced the signing of a definitive agreement for a SPAC merger with MedTech Acquisition Corporation (Nasdaq: MTAC). The merged company will have \$360 million cash and an equity value of more than \$1 billion.

Robots or companies whose status changed in 2026

Exits validate the category; the flameouts show that approval $\neq$ commercialization

EXITS & WINS

- **TrueHealth / 真健康 → HKEX IPO (Jun 30)**
+217% day one, ~HK\$14.3B cap, ~1,800× oversubscribed, capital is concentrating on the category leader
- **Edge Medical / 精锋 → Hang Seng Composite**
Index inclusion Jun 8; FY2025 revenue RMB 456M (+185%); overseas installs now exceed domestic
- **Stereotaxis × Robocath**
Endovascular consolidation (Apr 2026)
- **Ruichu Robotics → HKEX A1 filed (May 27)**
Pre-revenue lung-puncture robot chasing the TrueHealth window

WOUND DOWN / DELISTED

- **Vicarious Surgical (US)**
NYSE delisting Mar 3 (cap <\$15M) → OTC as RBOT; first 2026 Western flameout; dissolved 21 Jul 2026 (board-approved liquidation)
- **Asensus / Senhance + Luna (US/DE)**
Karl Storz discontinues both robots and retires the brand, a ~20-year program ends (strategic wind-down, not bankruptcy)
- **Longhui Medical / 龙慧 (China)**
NMPA approval Sep 2024 → bankruptcy Jan 2026: approval $\neq$ commercialization
- **Microya / 微亚 (China)**
Entire IP + assets auctioned from ~RMB 1.29M starting bid

Over half the field has no public funding story

Funding stage per company (normalized), 652 active companies; 11 acquired companies excluded (covered in the exits section)

332 NO PUBLIC FUNDING RECORD

50% of companies; mostly Chinese patent-only finds, institutes, and quiet SMEs

36 public companies bookend the other extreme

161 companies disclose a raise amount; Seed-to-B dominates the private tail

Best-funded private players

Ranked by disclosed capital raised (July 2026), per the master roster

Examples of insights from assessing a range of commercial efforts

What the collection teaches: form factors, topologies, consoles, controls

Simple squeeze vs complex handle

Those missing controls from the squeeze handle live somewhere...

Novel approaches

Representative examples

Major trends

Where the field is stuck, and where it should go next

- **Still too many robots in the same specialties**
...with similar approaches, and still too many full-platform solutions
- **Control-interface variety is a problem**
Physical and visual control interfaces differ widely from platform to platform
- **Just roboticizing what is done by hand is not enough**
First autonomous execution of a procedure phase supports this (Science Robotics, 2025)

GOING FORWARD

Opportunity for existing platform enhancement

- Operate in smaller and/or lower-resourced facilities
- Pay-per-use rather than capital + tool/drape purchases
- Lower capital cost · smaller footprints
- Wear-based rather than number-of-uses-based tool replacement
- Higher-power-density small actuators will change device configurations
- Judicious use of soft actuators as well as live hinges
- Legal frameworks and monetization of telesurgery

Machine learning

Everywhere, expected, penalized if absent; marketing still runs ahead of reality

- **The barrier to entry keeps dropping**

Technical and data-availability thresholds continue to fall; foundation models increasingly sit beneath specialist data

- **Most applications will be under the hood**

Optimizing the robot itself; more small, inexpensive sensors coupled with ML/AI video

- **Simulation for training content**

There is a strong case for simulation in creating training data and content

LEVELING OUTCOMES ACROSS LOCATION & SURGEON

Enhanced surgical-site situational awareness

- Contextualization relative to best practices
 - Ready availability of ad-hoc mentorship
 - Subtask enhancement / automation
 - Removing the need for technicians to run things
-
- Autonomous cholecystectomy phase demonstrated ex vivo, 8/8 (Kim et al., Science Robotics 2025)

Tools like Claude Code are accelerating and broadening use cases, but will need to be thorough in verification: they very quickly make things that look great but have unclear provenance

Surgical Robotics Watch, a live companion dashboard

An updating web version of the data underlying this deck, search, filter, sort, and drill into any company

Surgical Robotics Watch

The full surgical-robotics roster — companies and the robotic systems they build, with configuration, control mode, funding, founding year, status and provenance. Companion to the Surgical AI Watch. Tap any company for full detail.
