Surgical robotics today

Who are all these companies & How did they get here?

Dwight Meglan

8Nov26 Update · The commercial surgical robotics landscape

Companion to the Surgical AI Overview (July 2026)

All information discussed is derived from publicly available sources

Why me for this subject?

30+ years building surgical robots and simulators, and tracking everyone else's

- **Left Mayo tenure track 30+ years ago to stay an engineer**
  Building surgical simulators since 1994; surgical robots since 2000
- **Part of many investment & acquisition diligence efforts**
  Surgical robotics and adjacent: robotic systems, components and enablers; advanced visualization; machine learning
- **20+ years tracking commercial robots & simulators**
  I work at the system level, from idea to prototype

15 COMMERCIAL SURGICAL ROBOTS

Involvement across specialties:

- 4 Abdominal / thoracic
- 4 Endovascular
- 3 Endoluminal
- 2 Cardiac
- 1 Ophthalmic
- 1 Vascular access

linkedin.com/in/dmeglan

Why am I doing this?

A hobby that turned out to be useful, everything is a remix

- **I started collecting this information as a hobby**
  Knowing how similarly focused robots could have diverse solutions was useful for my design work (everything is a remix)
- **As the collection grew, others might find it useful**
  This deck is an overview of the field touching on the diversity of solutions for similar needs, e.g. surgeon consoles
- **I do deep dives for my own startup work and consulting**

NOTE

This talk is largely mechanics focused, but I typically work at the system level

- I work at the idea-to-prototype phase, i.e. typically much earlier than Steve Bell :-)

linkedin.com/in/dmeglan

This talk…

A scope contract: breadth over depth, commercial over academic

IS

- A quick run through the breadth of commercial efforts
- An update on what has changed in the past ~6 months
- Examples of how this information provides insight
- Robots that act upon the body in some manner
- A broad view of 'commercial', even patents alone

IS NOT

- By any means exhaustive
- Delving into the myriad academic efforts
- Covering rehabilitation or assistive robots

linkedin.com/in/dmeglan

Surgical robotics today: update notes, July 2026

What changed since the January 2026 edition

- **774 robots now, 658 in January**
  Roster 774 robots / 677 companies. 57 robots first seen in 2026: 8 orthopedic, 7 abdominal/thoracic, 6 percutaneous, 6 endoluminal, 4 spine… 33 of the 57 are Chinese, mostly EPO patent-scan finds, not press
- **Full roster re-verification, 1–2 July**
  532 field corrections, 121 new milestones, duplicates merged; quietly-approved systems re-checked, On Market count: 86 in January → 243 now
- **Funding data added for every robot**
  Stage, total raised, lead investors, valuation and most-recent-milestone columns now populated throughout

ALSO NEW IN THIS EDITION

- Funding & investor data throughout
- 2026 flameouts & exits section
- Founding-year (vs first-evidence) view
- All charts regenerated from the master roster
- Live companion dashboard, see the end of the deck

linkedin.com/in/dmeglan

Big picture on surgical robotics

Note: most stats reflect robots, not robot companies: the roster is one row per robot

linkedin.com/in/
dmeglan

Surgical robotics is a busy place

316 review articles in 2020–2022 per the refreshed counts; a sampling of 2022 titles below

HISTORY & OVERVIEWS

A short history of robotic surgery · Past, present and future of surgical robotics · An introductory review of robotically assisted surgical systems

IMAGING & GUIDANCE

Image-Guided Interventional Robotics: Lost in Translation? · Robot-Assisted Medical Imaging: A Review · MRI-Guided Robot-Assisted Surgery and Interventions

SPECIALTY-SPECIFIC

Robotics in neurosurgery · Intraocular Robotic Surgical Systems · Robot-assisted techniques in vascular and endovascular surgery · Robotic Systems in Radiotherapy

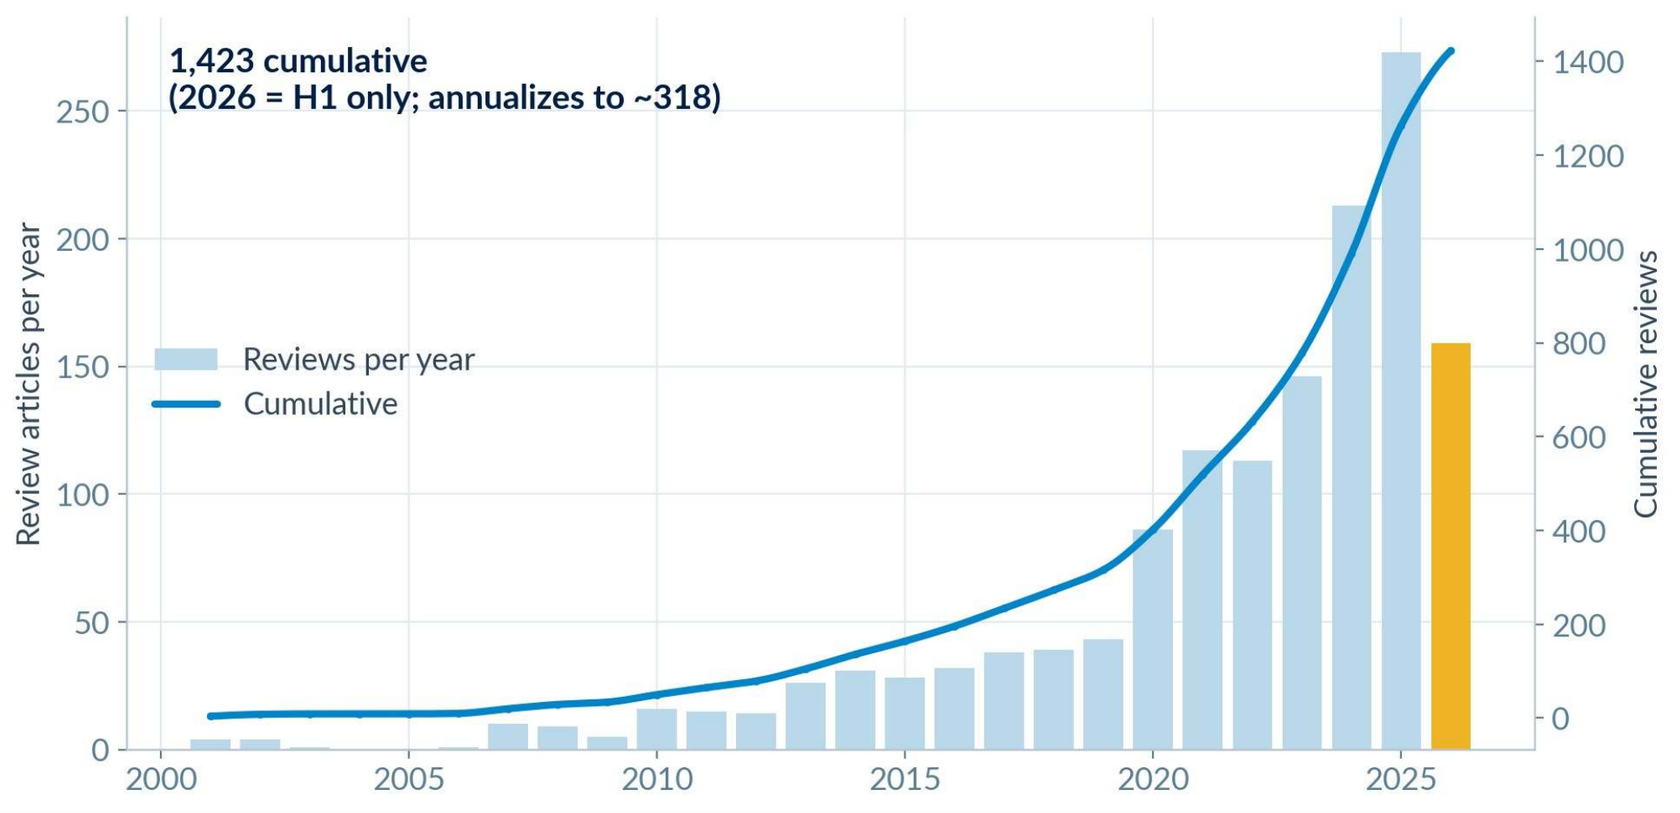

EMERGING TECH

Magnetically Actuated Medical Robots · Surgical Robotics in the Data Age · among others published in 2022

Source: Google Scholar, review-article searches on surgical robotics, 2020–2022.

Surgical robotics is a busy place

Review articles per year, Google Scholar, refreshed 7 Jul 2026; 2026 = first half, actual

1,423 REVIEWS

cumulative since 2001

273 in 2025; 159 in H1 2026, annualizing to roughly 318

Same Google Scholar query as prior editions; counts refreshed 7 Jul 2026

Where it came from

knowablemagazine.org, Handing the surgeon's scalpel to a robot (2022)

Timeline of progress in surgical robots

1970s NASA explores telesurgery.

1983 First robot in the surgical suite, used to move patient's limbs into position during orthopedic surgery.

1985 First instance of a surgical robot, used during brain biopsy to avoid errors from hand tremors.

1985 First laparoscopic procedure.

1990s Laparoscopic surgery becomes more common, many novel procedures carried out and many new systems invented.

1991 First telepresence system, means surgeons don't need to be directly next to patient.

1992 First robot with task autonomy gets FDA approval. Used in hip replacement, ROBODOC can carry out certain pre-programmed tasks autonomously once initiated by a human.

2000s Surgical robots for general use become more common.

2000 Introduction of da Vinci, the first robotic system for general and laparoscopic surgery in humans.

2001 Doctors in New York City use telesurgery to operate on a patient in France.

2001 First robot with conditional autonomy gets FDA approval. Used in radiation therapy, CyberKnife can perform procedure autonomously.

2001 – present Refinement of existing surgical robots continues to expand, robots become smaller, lighter, easier to use, and offer more assistance features for surgeons.

2009 Steerable catheters to access and operate constrained regions not reachable with rigid laparoscopy.

2022 STAR robot successfully sutures severed pig intestine.

The future Surgical robots gradually acquire increasing autonomy.

Commercial milestones

T Ginoya et al., A Historical Review of Medical Robotic Platforms, J. Robotics 2021, doi.org/10.1155/2021/6640031

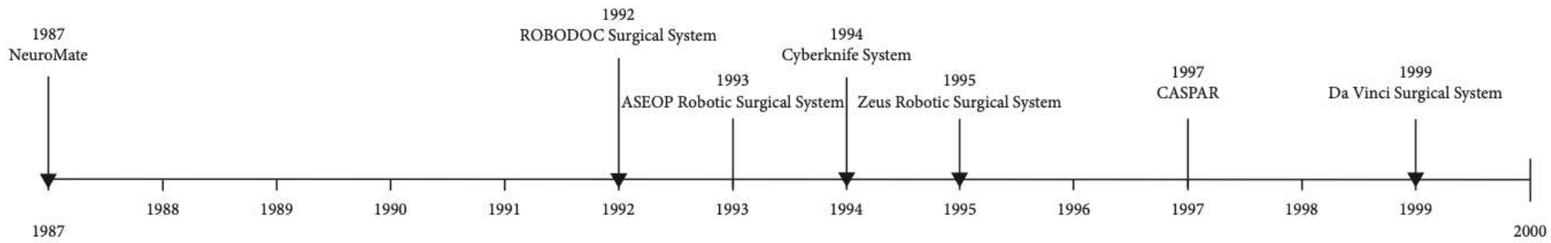

FIGURE 1: Decade I: timeline of robotic systems that founded and created the base for usage of robots in the medical field.

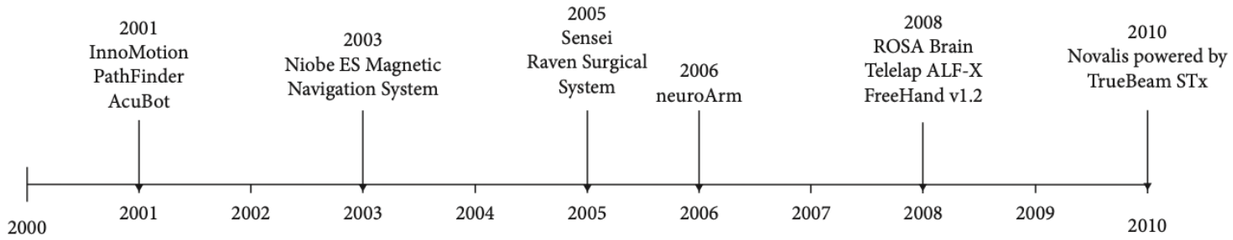

FIGURE 2: Decade II–timeline of robotic systems that signify the progress of the development curve of Robots in medical application.

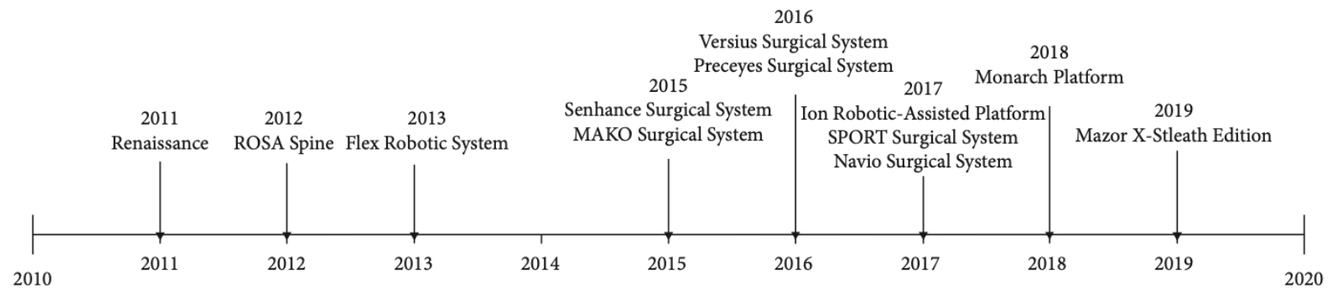

FIGURE 3: Decade III–timeline of robotic systems that show the recent advancement in the field of medical robots based on the advancement of technology and effort of three decades of research in this field.

Commercial surgical robotics trends

Five parts: the roster today · how fast it grew · where · specialty waves · the endovascular case.
Stats reflect robots, not companies.

linkedin.com/in/
dmeglan

Lots of bots, mostly on the way

Roster · the field at a glance; there are more: stealth and non-US companies evade detection

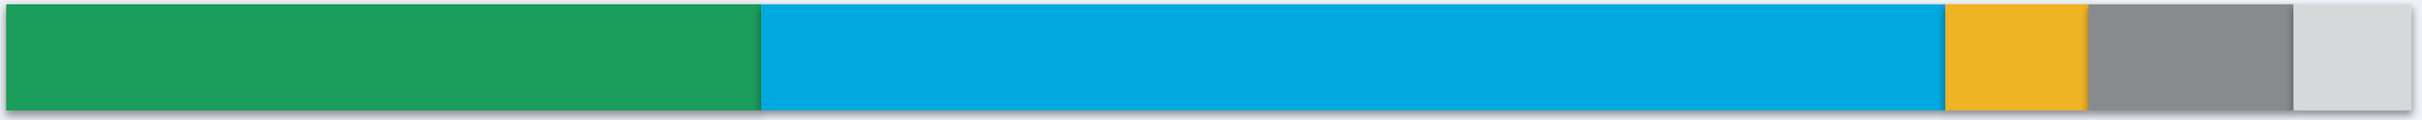

774
robots tracked

677
companies

243
on market

67
multi-robot companies

STATUS OF THE 774 ROBOTS

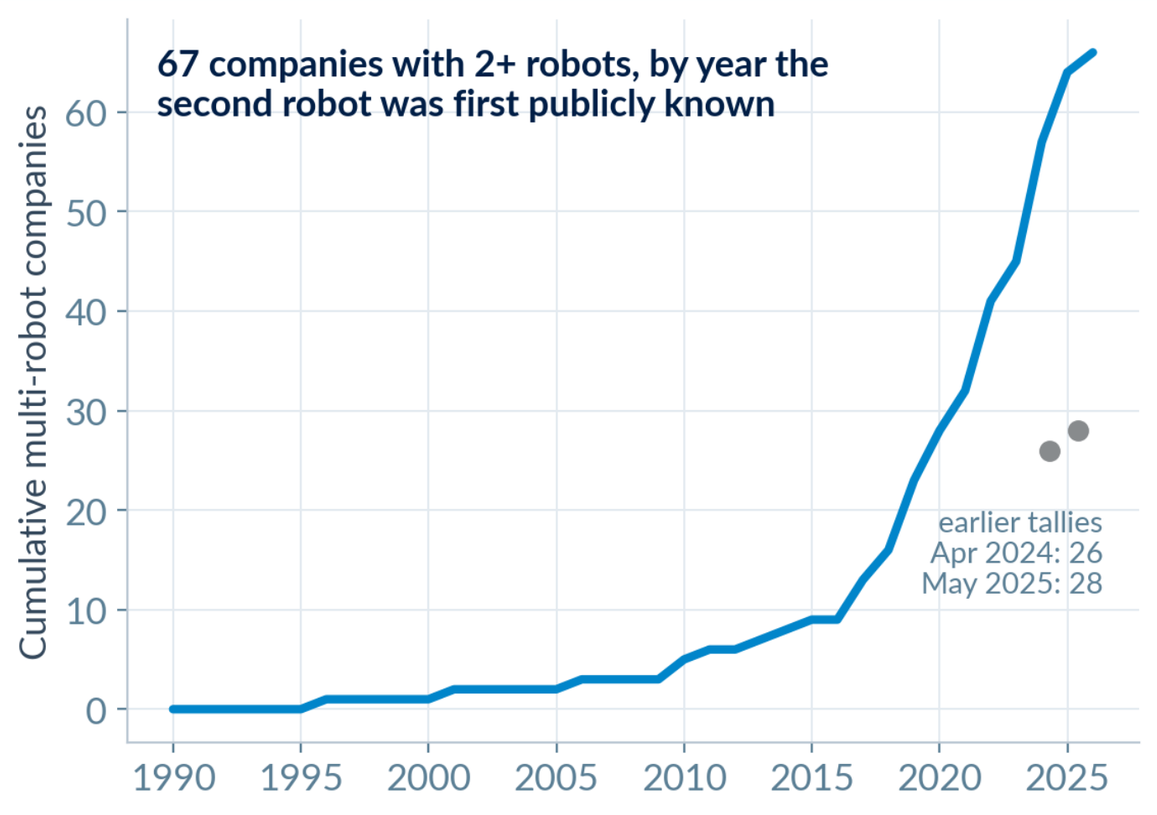

On Market (243) Under Dev (381) Acquired (46) Dead (66) Uncertain (38)

On Market re-verified against regulator databases & company disclosures. Rows are robots; companies counted once across multi-robot portfolios.

linkedin.com/in/
dmeglan

Multi-robot portfolios are mostly recent

Roster · sources: patent filings, FDA/NMPA submissions, press releases, papers; collected 8-11 Jul 2026

67 MULTI-ROBOT COMPANIES

10% of tracked companies field two or more robots

Dated by first public evidence for each second robot: patent filing, FDA/NMPA submission, press release, or paper

57% went multi-robot in 2021 or later; earlier edition tallies (26, 28) lagged detection

linkedin.com/in/dmeglan

How they work

Roster · control philosophy across all 774 robots; teleoperation still dominates

489
teleoperation

175
preplanned

82
autonomous

28
handheld & other

CONTROL MODE OF THE 774 ROBOTS

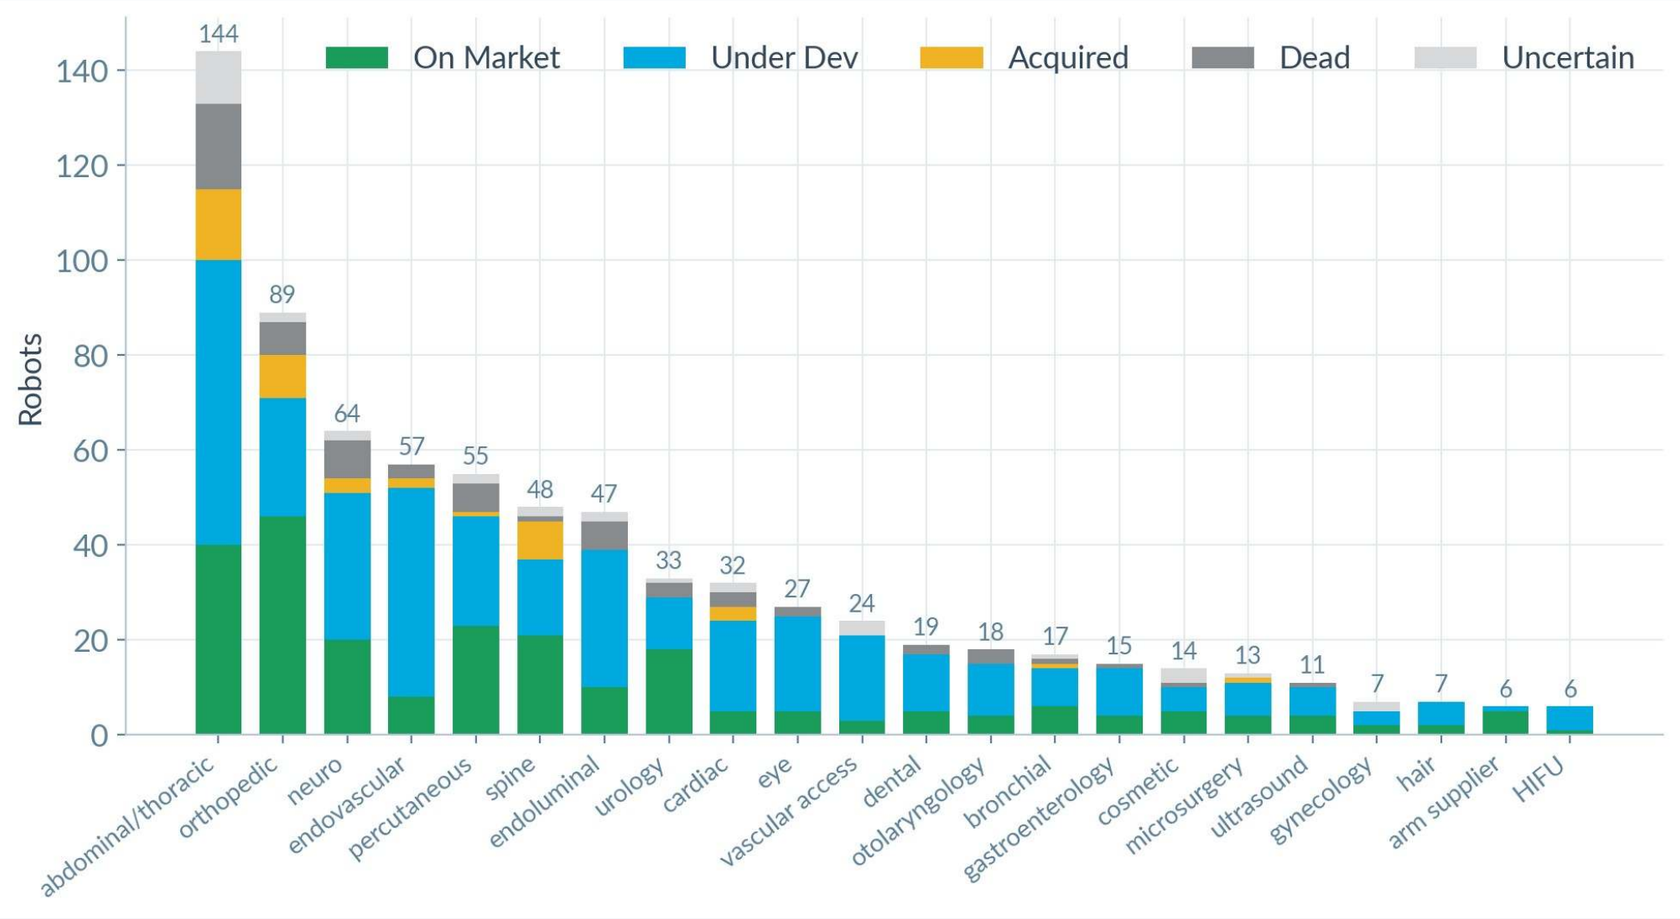

Teleoperation (489) Preplanned (175) Autonomous (82) Handheld / manual / cooperative (28)

Autonomous roughly doubled since January (37→82), partly reclassification during re-verification, partly a real trend.

linkedin.com/in/
dmeglan

Focus is still predominantly in abdominal procedures

Roster · 774 robots by focus area, colored by status

144 ABDOMINAL / THORACIC

Orthopedic (89) and neuro (64) follow

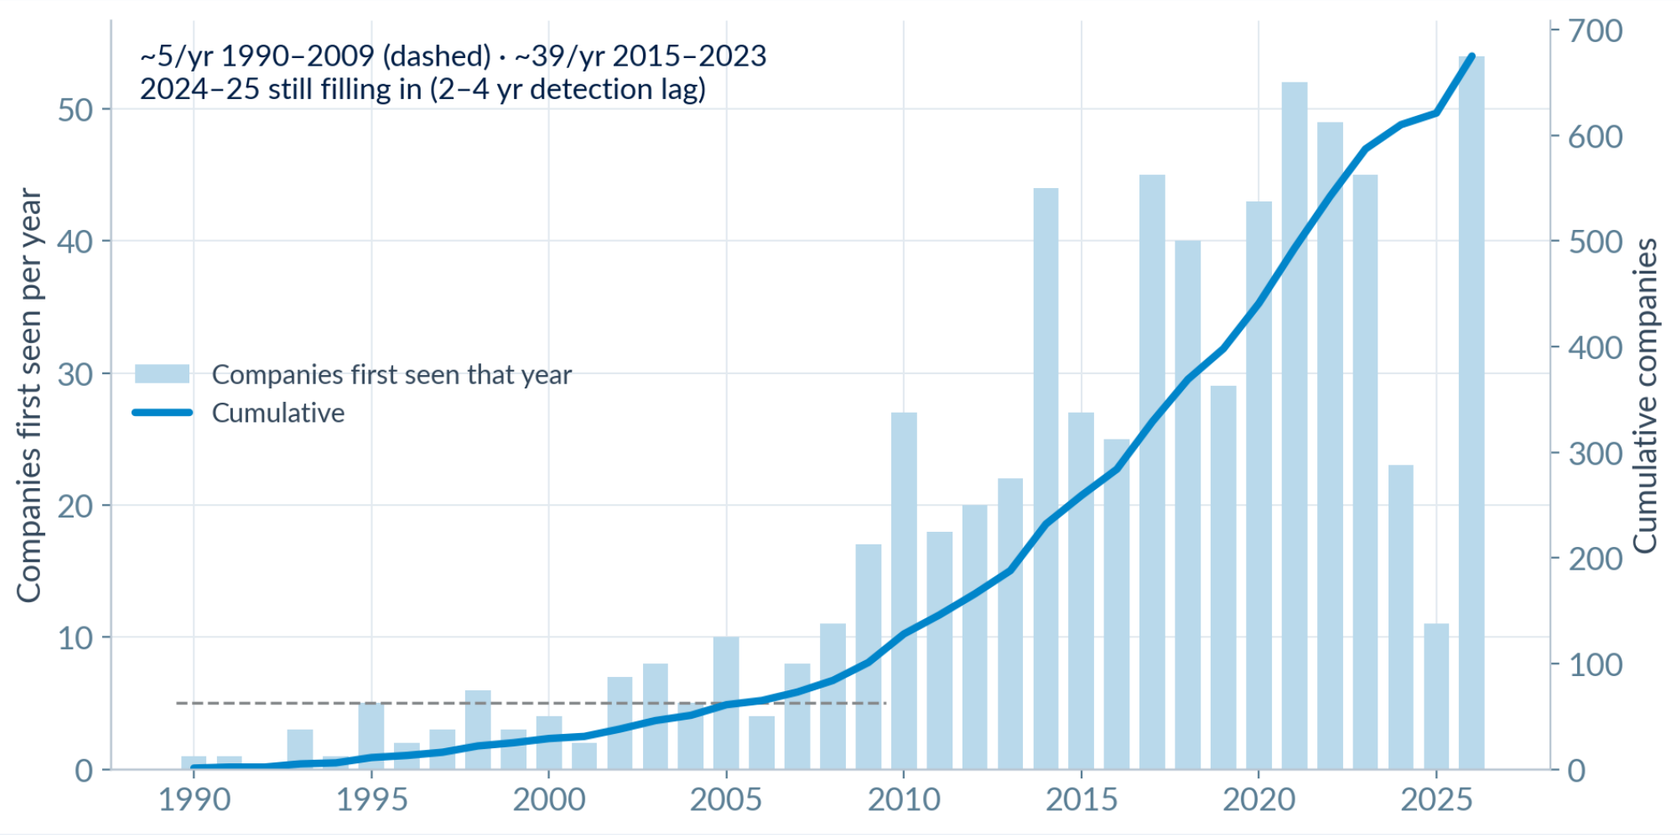

A long tail of 32 focus areas

New categories since January: airway, regional anesthesia, trauma, podiatry, arm supplier

linkedin.com/in/dmeglan

Company formation inflected around 2010

Growth · companies first seen per year, with the cumulative total

677 COMPANIES

About 5 per year before 2010

About 39 per year in 2015–2023

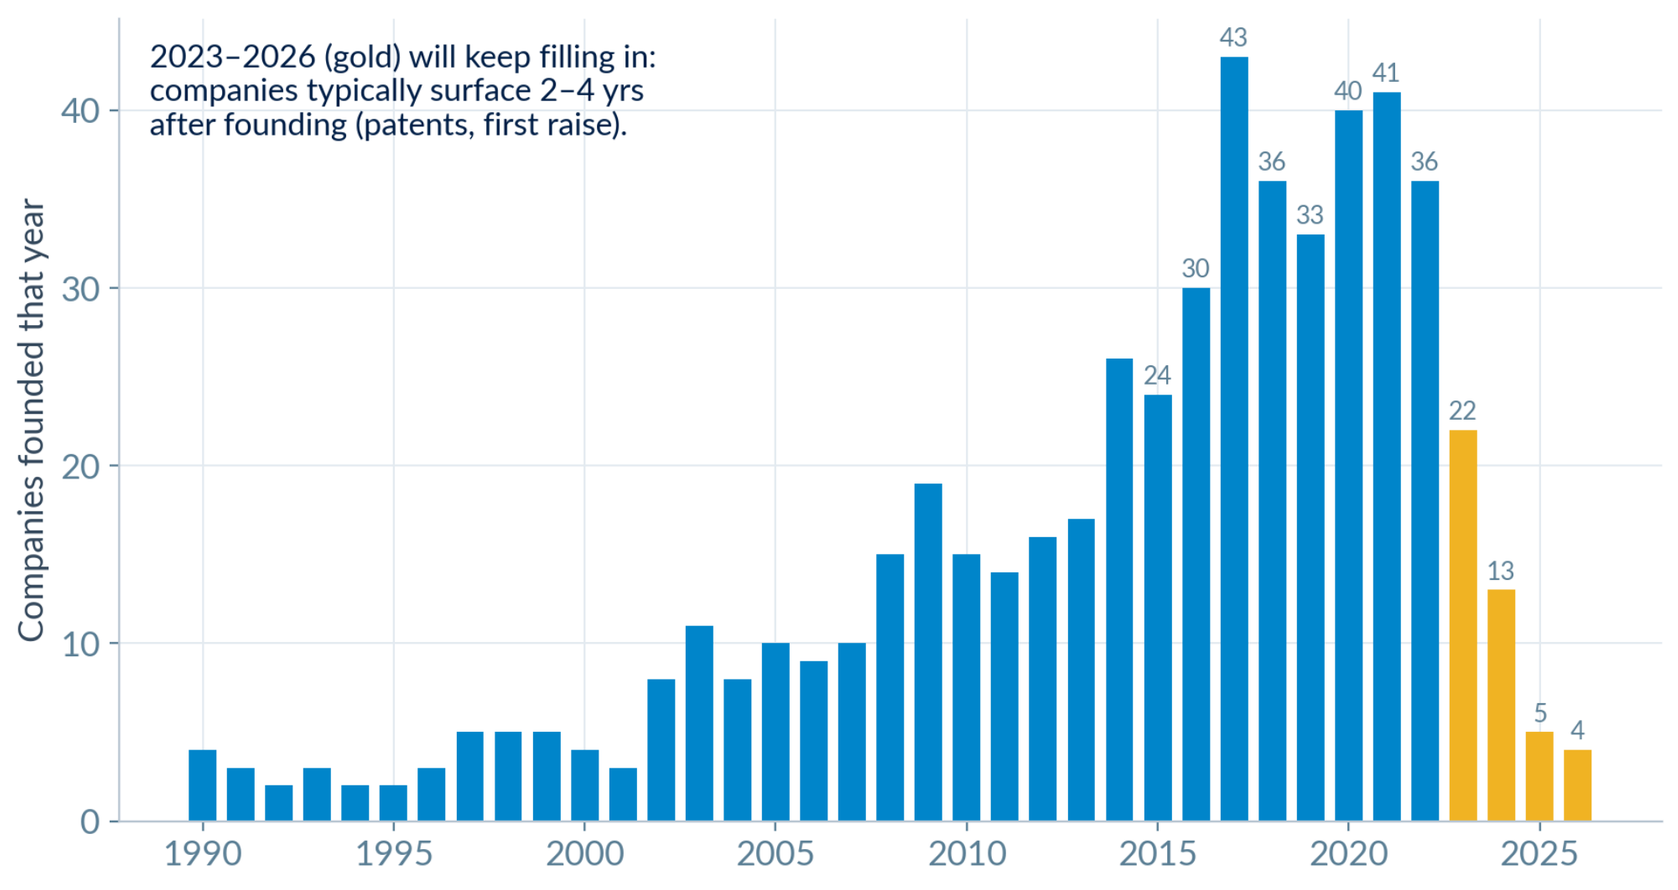

2024–25 look low only because companies take 2–4 years to become detectable

2026 shows a bump because of improved detection which affects first year of detection

linkedin.com/in/dmeglan

By founding year, the field is younger than it looks

Growth · companies by founding year; the Founded column is populated for 573 of 677 companies

DETECTION LAG

Companies typically surface 2–4 years after founding

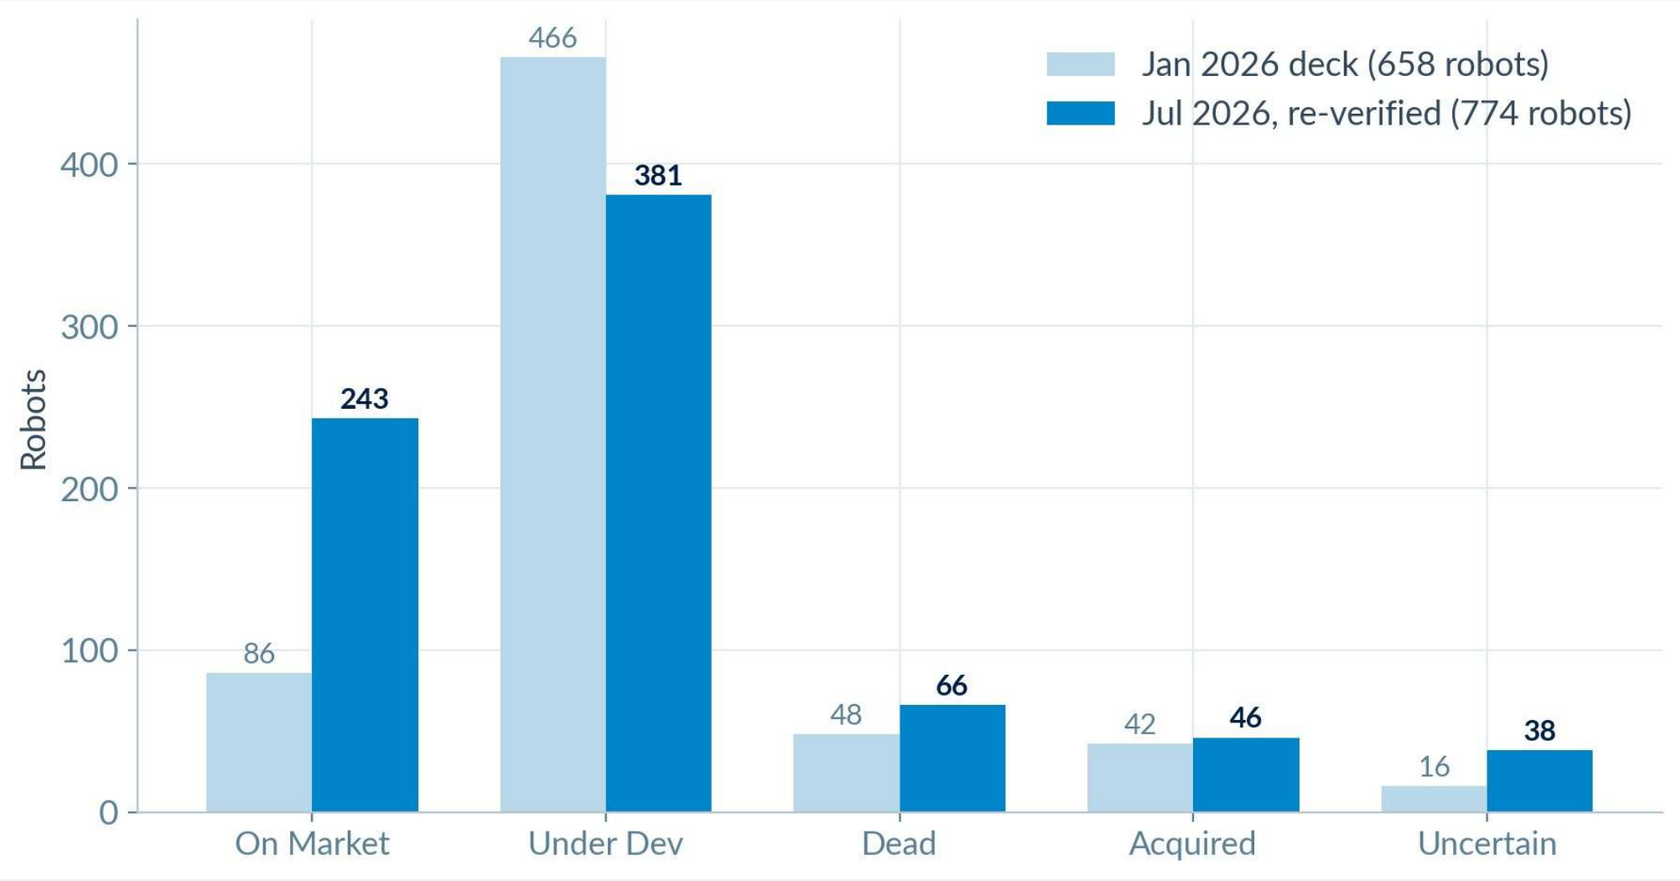

First signals are patents and first raises, which lag incorporation

Expect the 2023–2026 bars to keep growing in future editions

linkedin.com/in/
dmeglan

The commercial wave is bigger than it looked

Growth · re-verifying every company tripled the on-market count; China's approvals were undercounted

86 → 243 ON MARKET

What changed

Jul 1–2 re-verification checked every row against NMPA/FDA/CE records and company disclosures

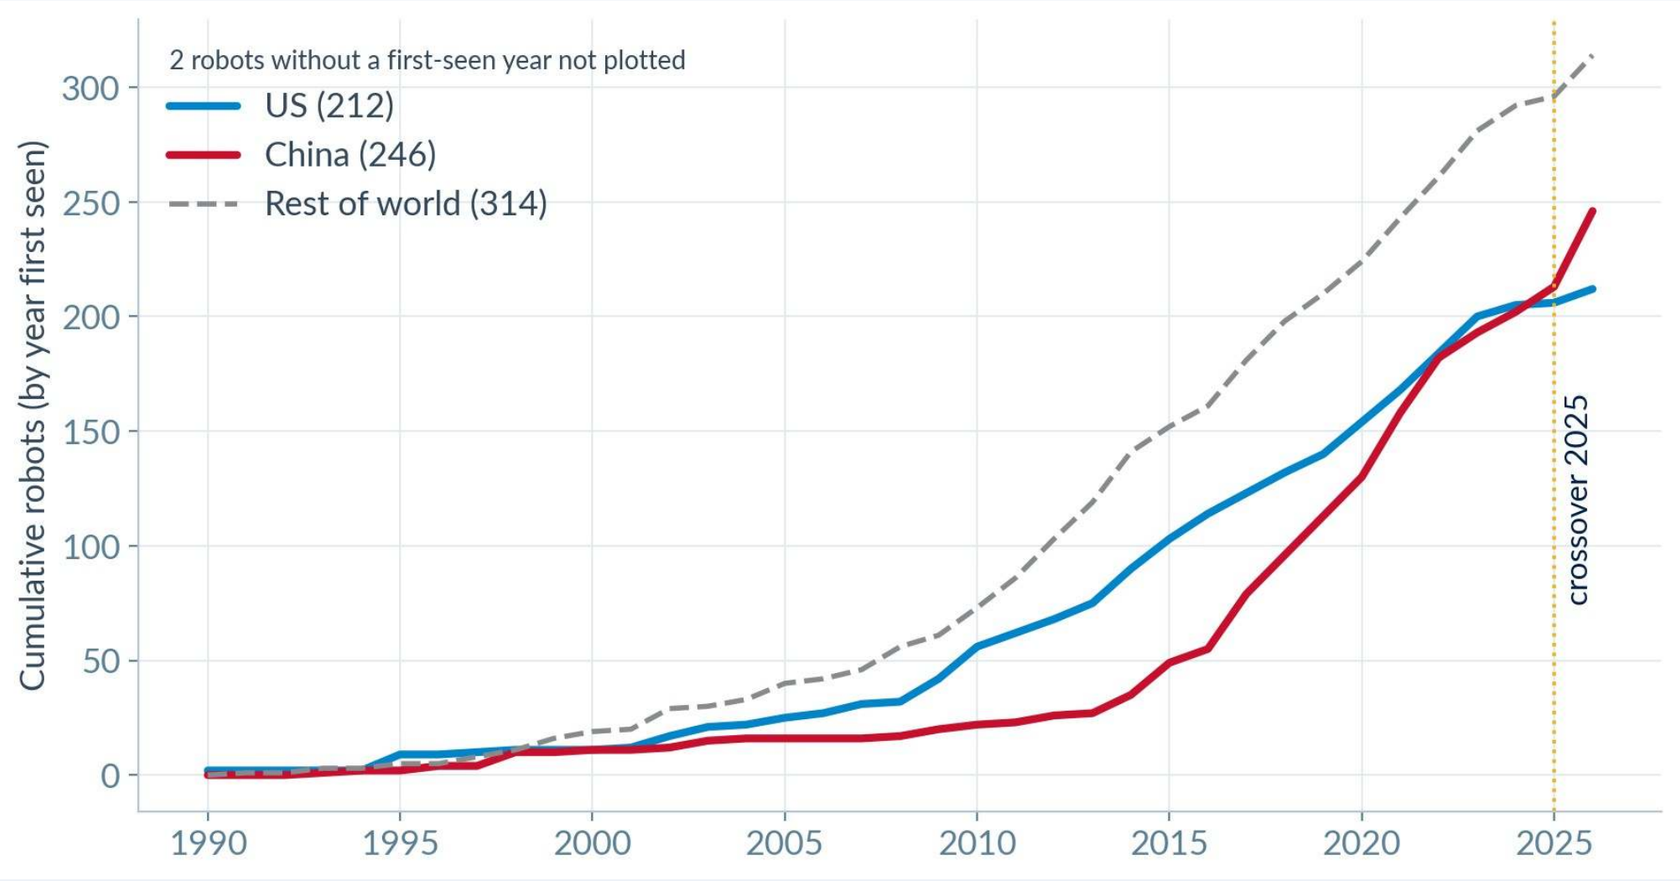

Many Chinese systems had approvals & installs that never made English-language press

Dead (48→66) and Uncertain (16→38) also grew, attrition was undercounted too

linkedin.com/in/dmeglan

China surpassed the US in total surgical robots

Geography · cumulative robots by year first seen, China 246 vs US 212 today

246 vs 212

China vs US robots

There is detection lag in the US/China counts

Company-level counts mirror this crossover; detection lag on Chinese companies means the true gap is likely wider

linkedin.com/in/dmeglan

Robots by country of origin

Geography · each circle is a country, area proportional to robots tracked

36 COUNTRIES

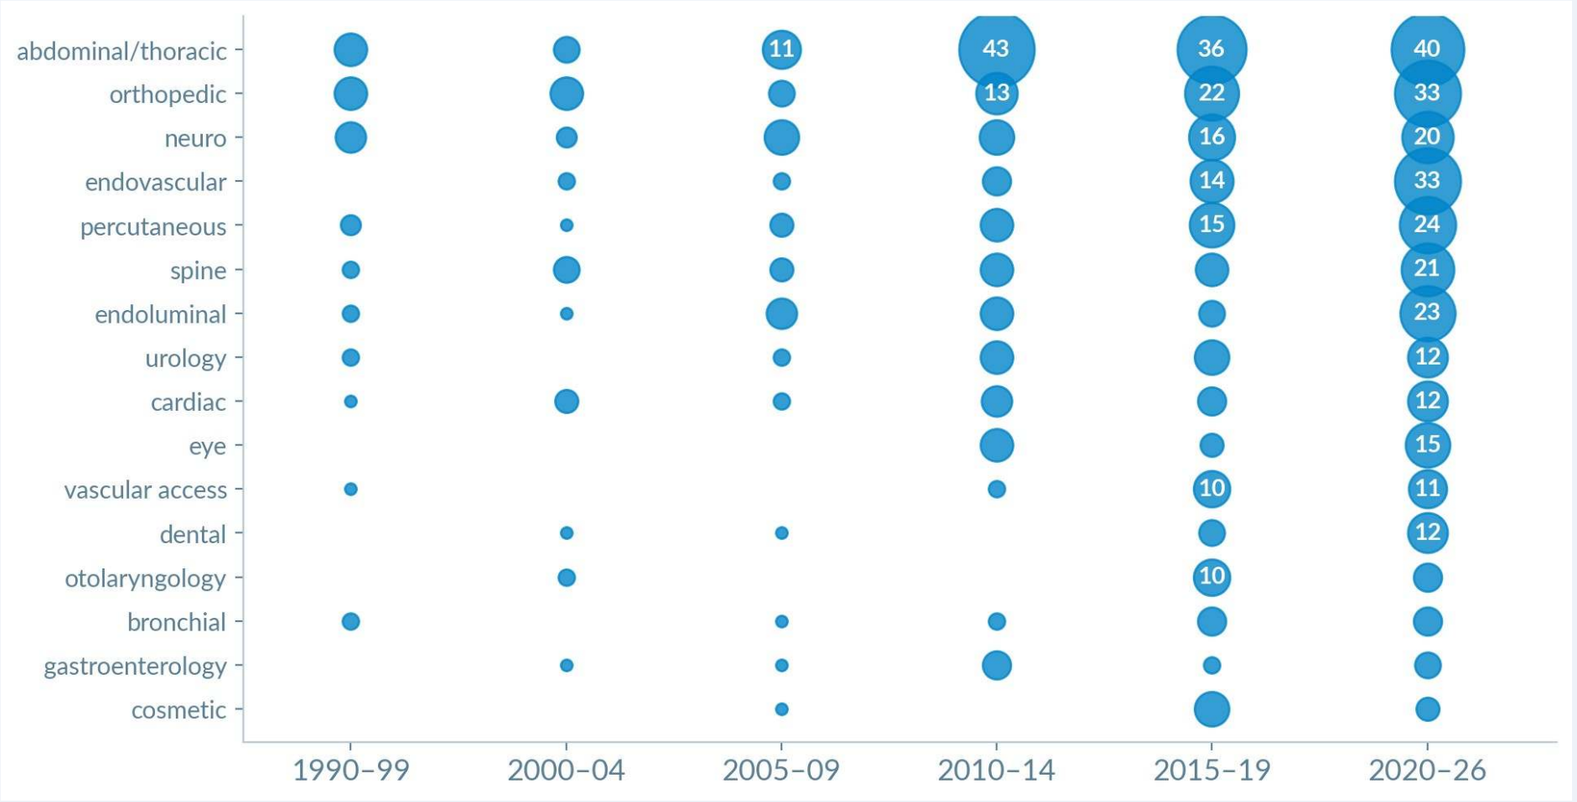

US + China = 59% of all robots

France (49), Korea (39), Germany (30) lead the tail

China's share of new robots by era: 13% through 2014, 40% in 2015–19, 43% since 2020

Global specialty robots development start

Specialty waves · Tufte-style period matrix; dot size = robots first seen in that period

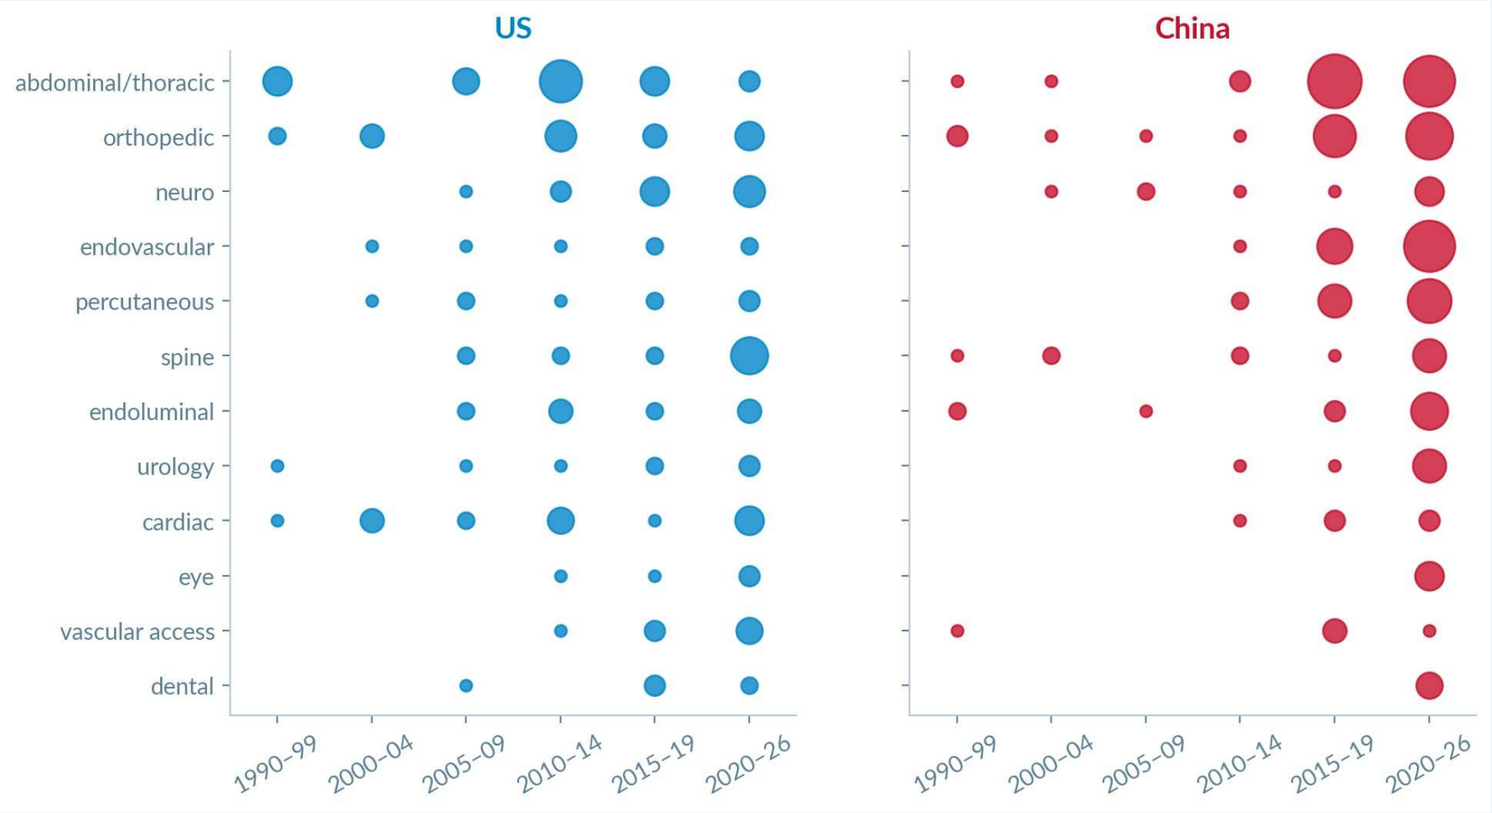

Read across a row to see when each specialty became active; read down a column to see what each era produced.

linkedin.com/in/
dmeglan

China and US robots started, by specialty

Specialty waves · side-by-side period matrices; dot size = robots first seen

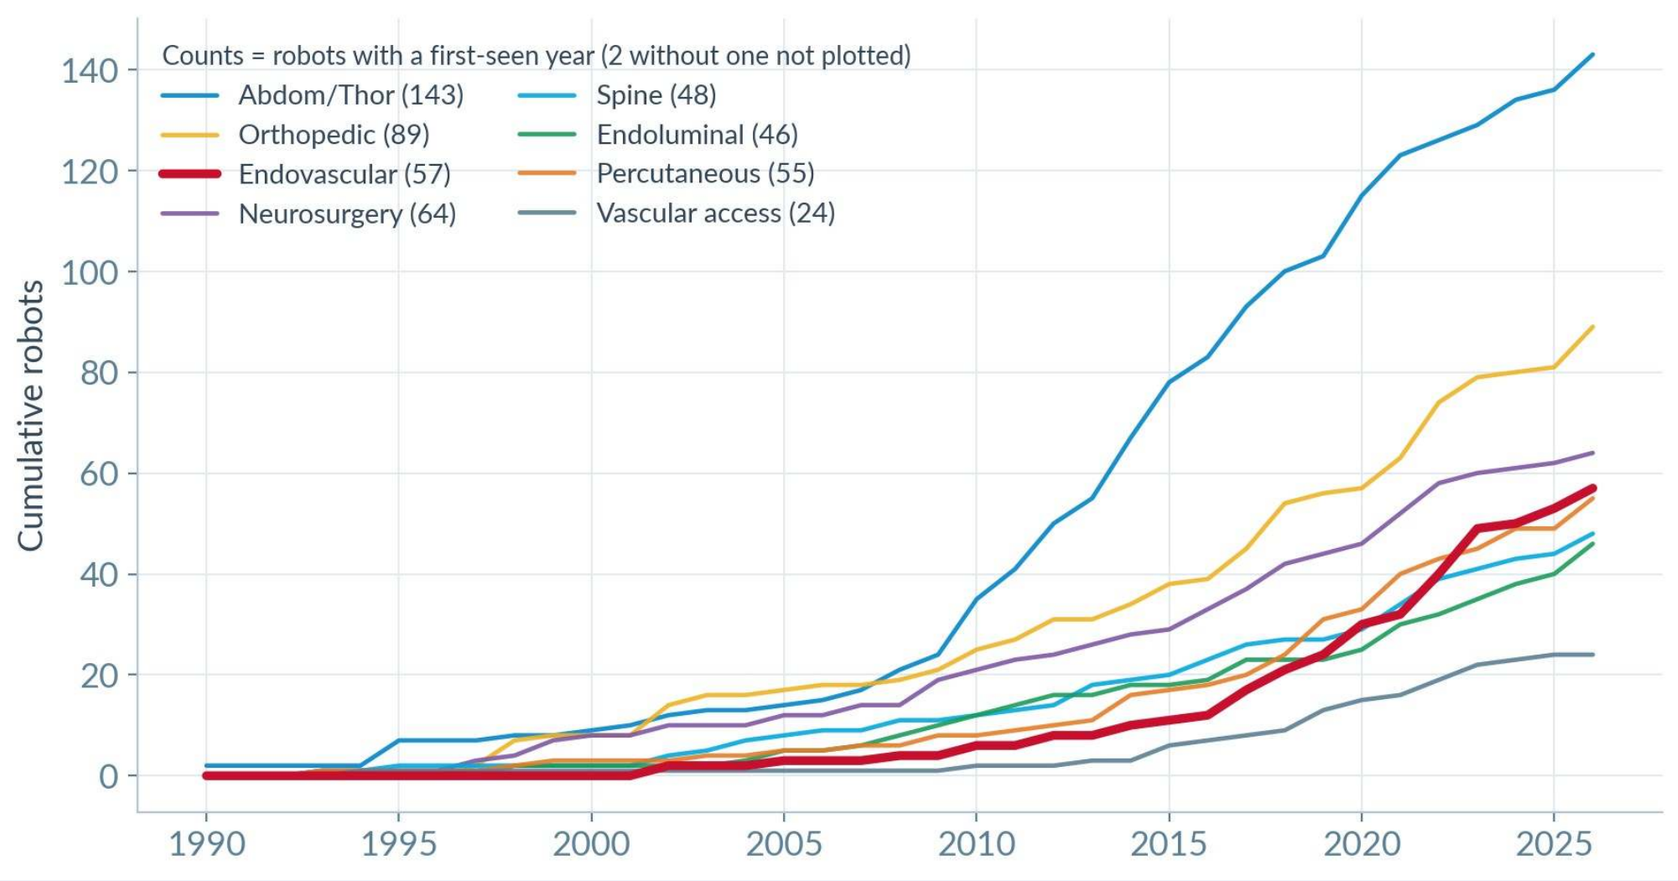

The US spreads across specialties and decades; China concentrates hard in 2015–2026, especially abd/thor, endovascular, percutaneous and orthopedic.

linkedin.com/in/
dmeglan

One specialty breaks the pattern

Endovascular case · cumulative robots by specialty; one curve does not fit the pattern

57 ENDOVASCULAR ROBOTS

Roughly 3/4 began after 2015

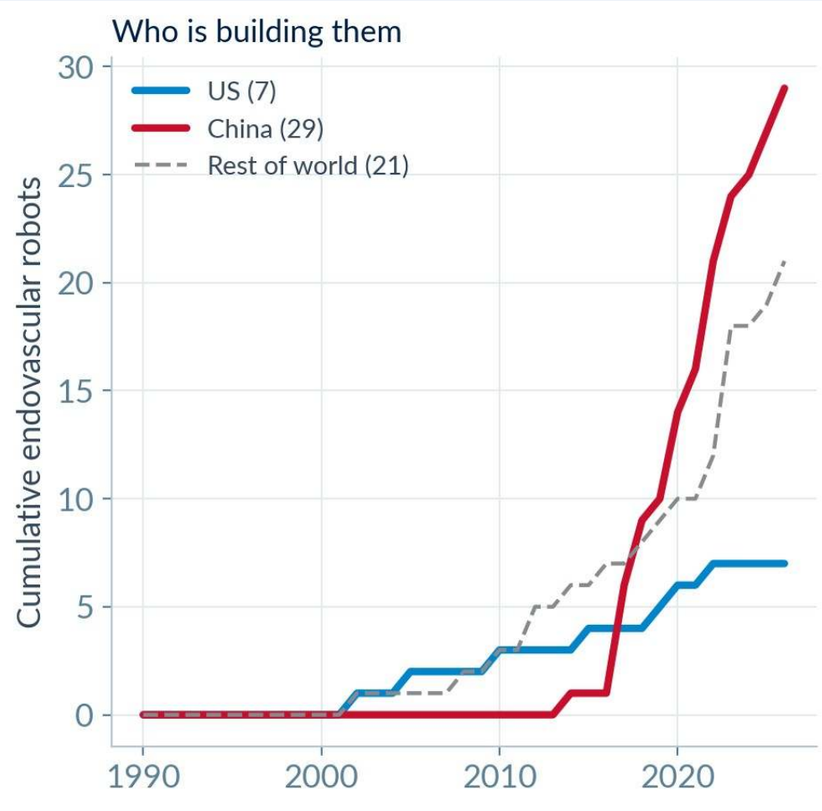

The steepest specialty curve of the last decade

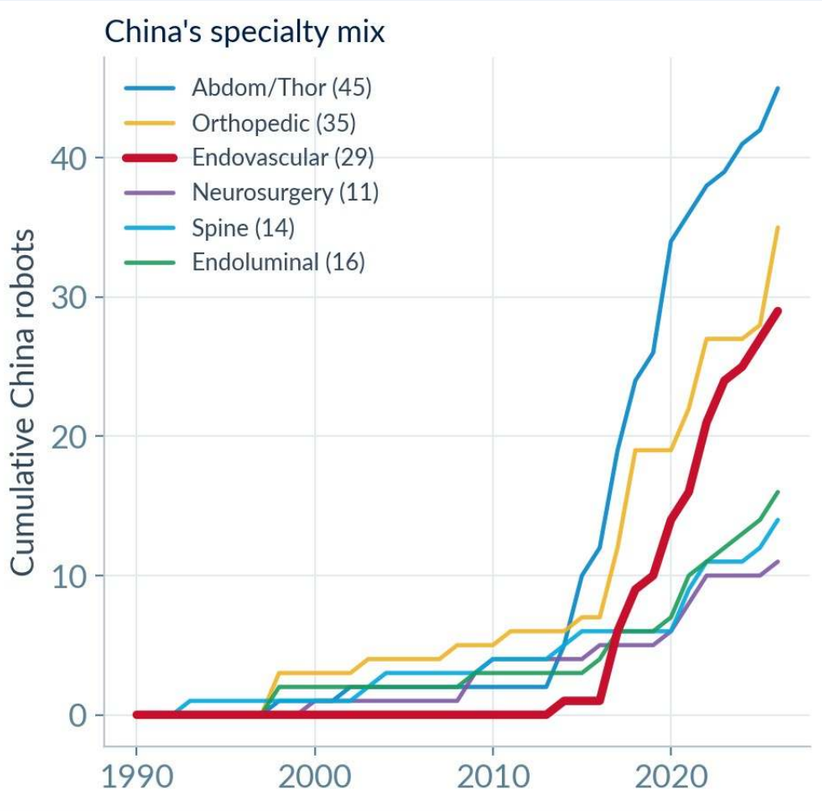

China drives the spike; next slide

linkedin.com/in/dmeglan

China accounts for the majority of the endovascular increase

Endovascular case · attribution in two views: who is building them, and China's specialty mix

CHINA'S WAVE

Endovascular was a US and EU niche until about 2015

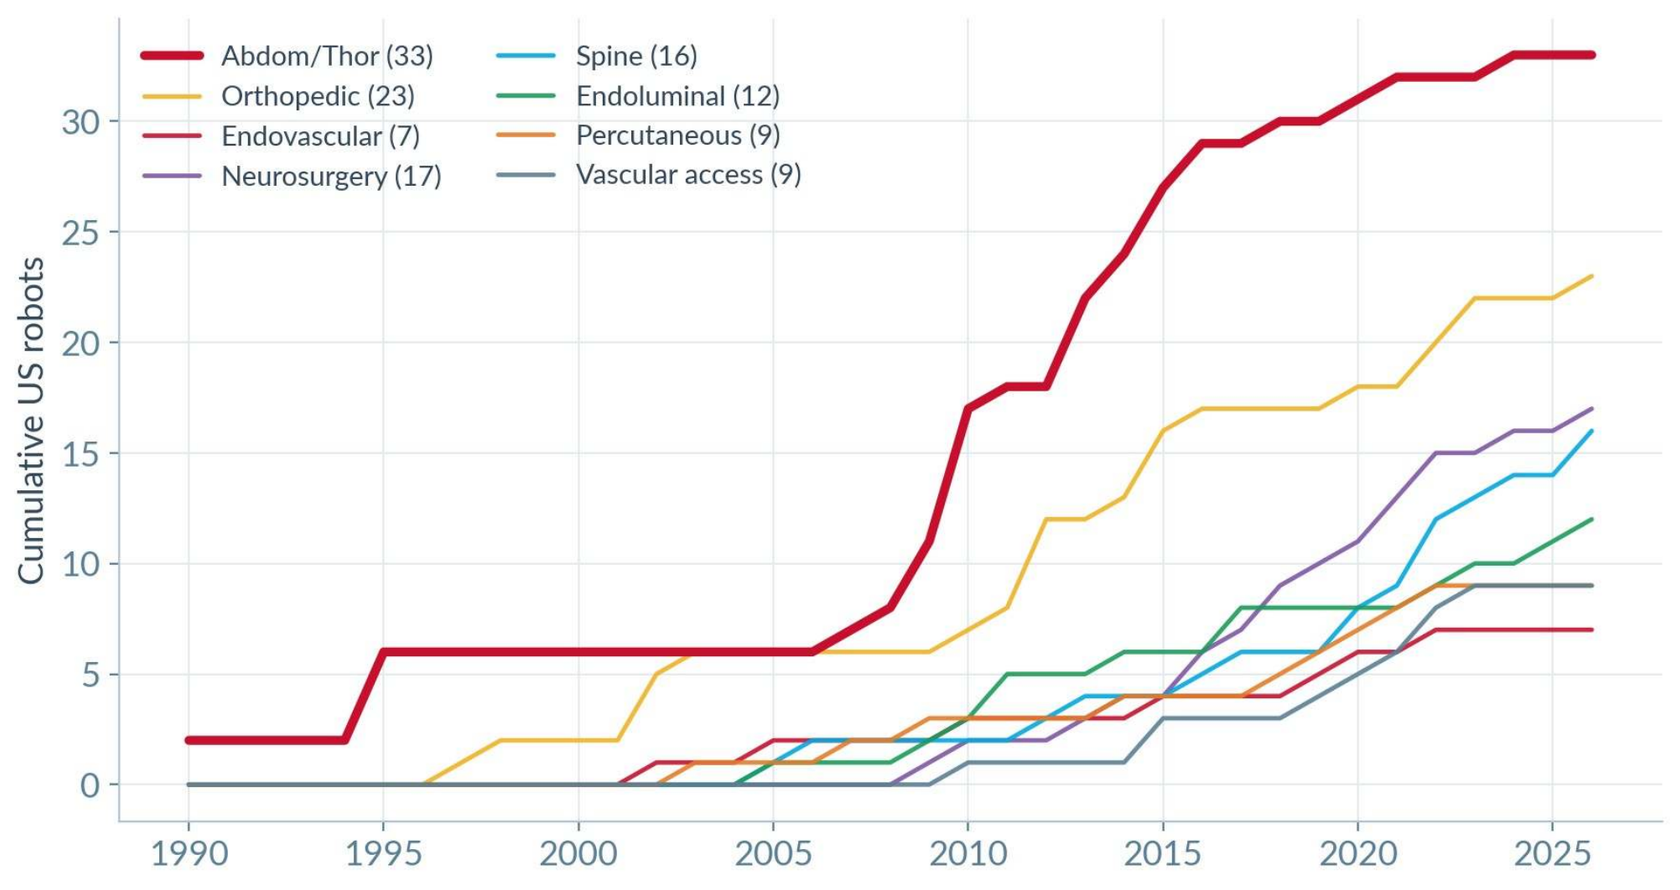

China's curve bends sharply upward from 2018

Within China, endovascular is among the steepest specialty curves

linkedin.com/in/dmeglan

US: abdominal/thoracic wave, steady orthopedic growth

Endovascular case · the US contrast: cumulative US robots by specialty

US PATTERN

Abdominal/thoracic keeps compounding despite the da Vinci incumbency

Orthopedic growth has been steady

Endovascular stays a modest US category, the contrast with China is the story

linkedin.com/in/dmeglan

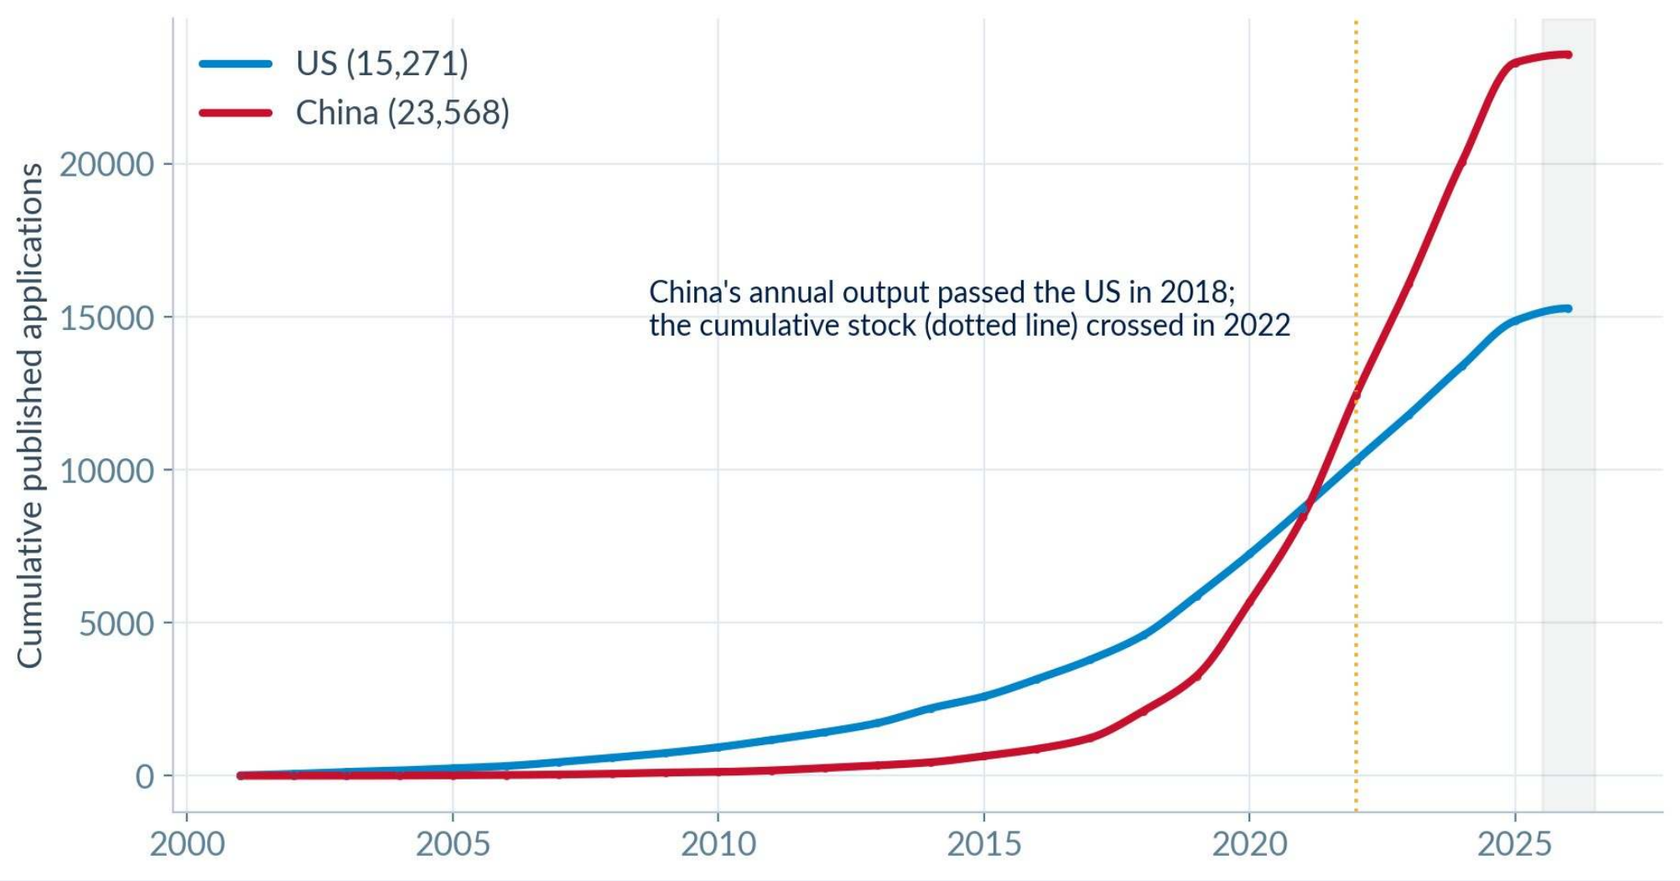

Commercial surgical robotics patent trends

Four questions: how much and where · what the filings cover · who holds it · how much is genuinely new

linkedin.com/in/
dmeglan

Overall surgical robotics patent applications: US & China

Cumulative published applications, A61B34/30 incl. subgroups, like-for-like basis, refreshed 7 Jul 2026

23,568 vs 15,271

China vs US cumulative applications

China's annual output passed the US in 2018; the cumulative stock crossed in 2022

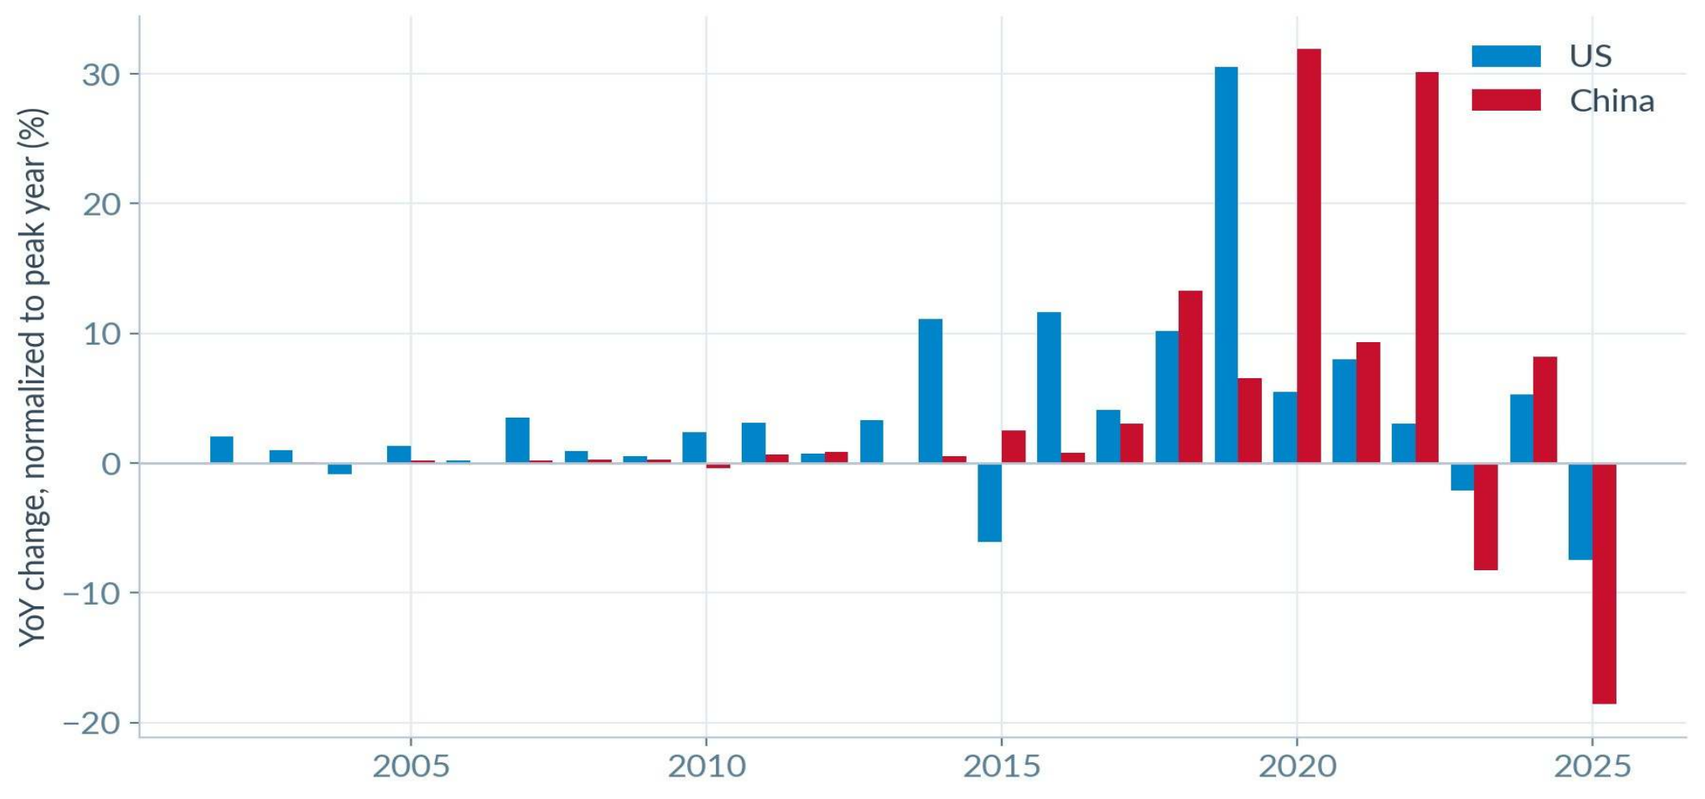

Earlier editions mixed counting bases and overstated the gap; like-for-like, China's annual output is ~2.5x the US (2024) and its cumulative stock ~1.5x

Source: Google Patents result counts, q=(A61B34/30) country:US/CN, applications only, by publication year; collected 7 Jul 2026

linkedin.com/in/dmeglan

US & China patents: normalized year-on-year change

(Year[n] − Year[n−1]) / peak year, normalized to each country's maximum

CHINA'S MOMENTUM

China's normalized year-on-year gain exceeded the US gain in 7 of 16 years (2010–2025); its largest jumps came in 2018–2022

Both countries decelerate after their peaks: China 2022, US 2024

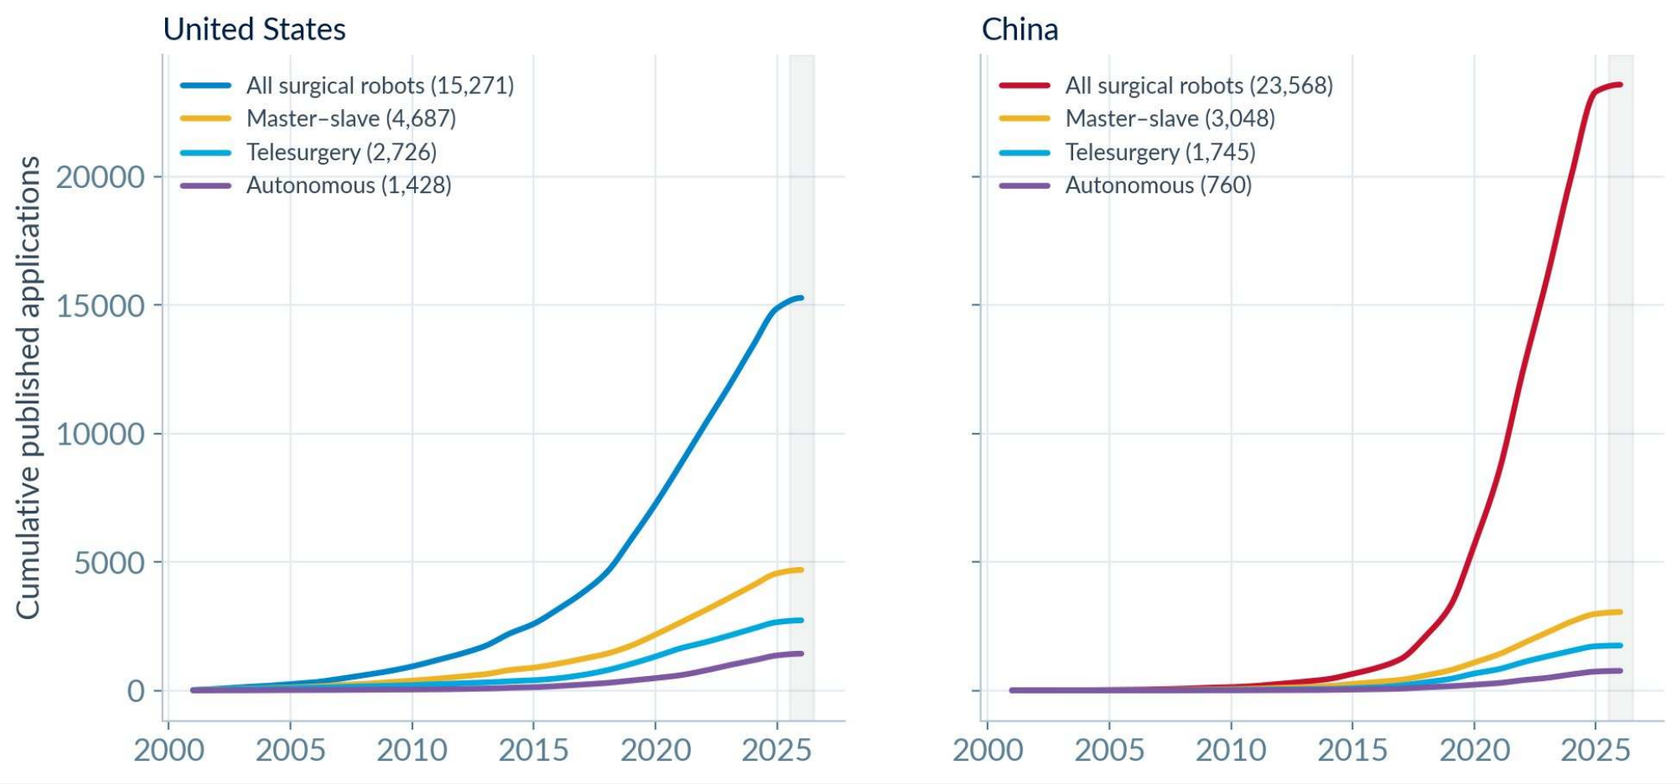

2023-2025 values are understated by the ~18-month publication lag; treat recent bars as provisional

Source: Google Patents counts, same query as the previous slide

Normalization anchors: US peak 1,595 published applications (2024); China peak 3,980 (2022). 2026 excluded (partial year).

What the filings cover: US and China by CPC subgroup

Cumulative published applications by CPC subgroup; both panels share the same vertical scale. Source: Google Patents result counts, q=(A61B34/3x), applications only, by publication year; collected 7 Jul 2026

SAME CATEGORIES, SAME SCALE

All surgical robots (34/30 incl. subgroups), master-slave, telesurgery, autonomous

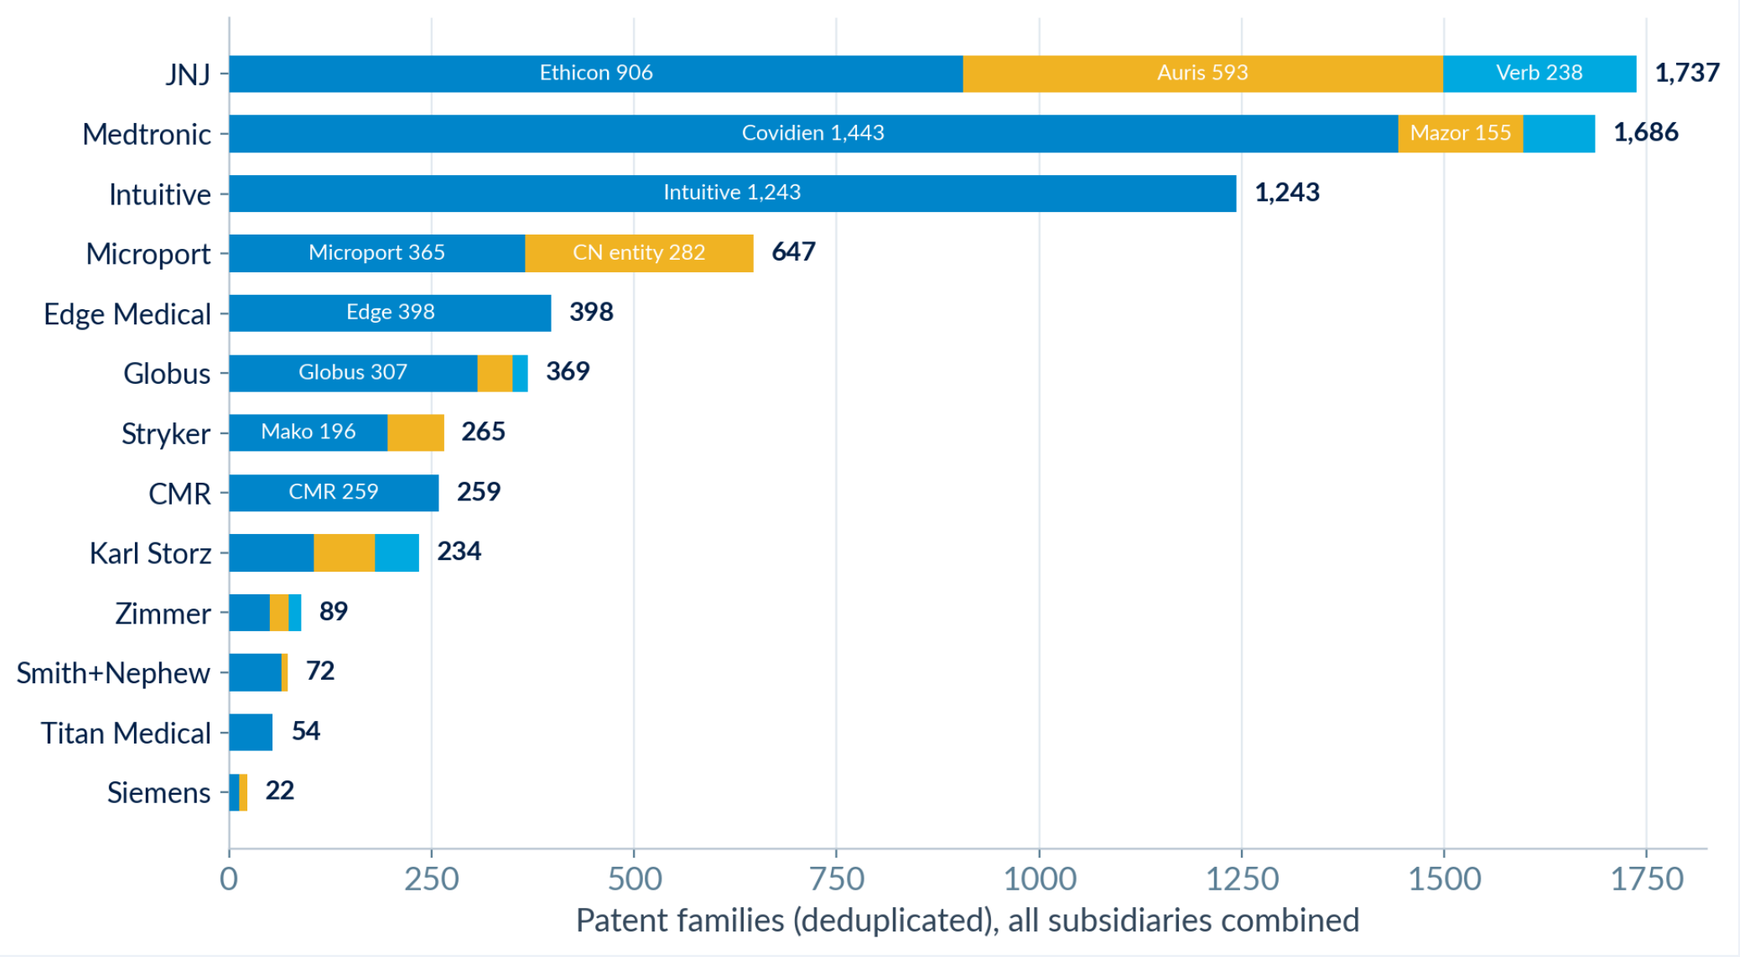

China's curves accelerate the most after 2018

Source: Google Patents result counts, q=(A61B34/3x) with country and status filters, by publication year; collected 7 Jul 2026; 2026 is first-half only

linkedin.com/in/dmeglan

For IP, you need to count all the parts

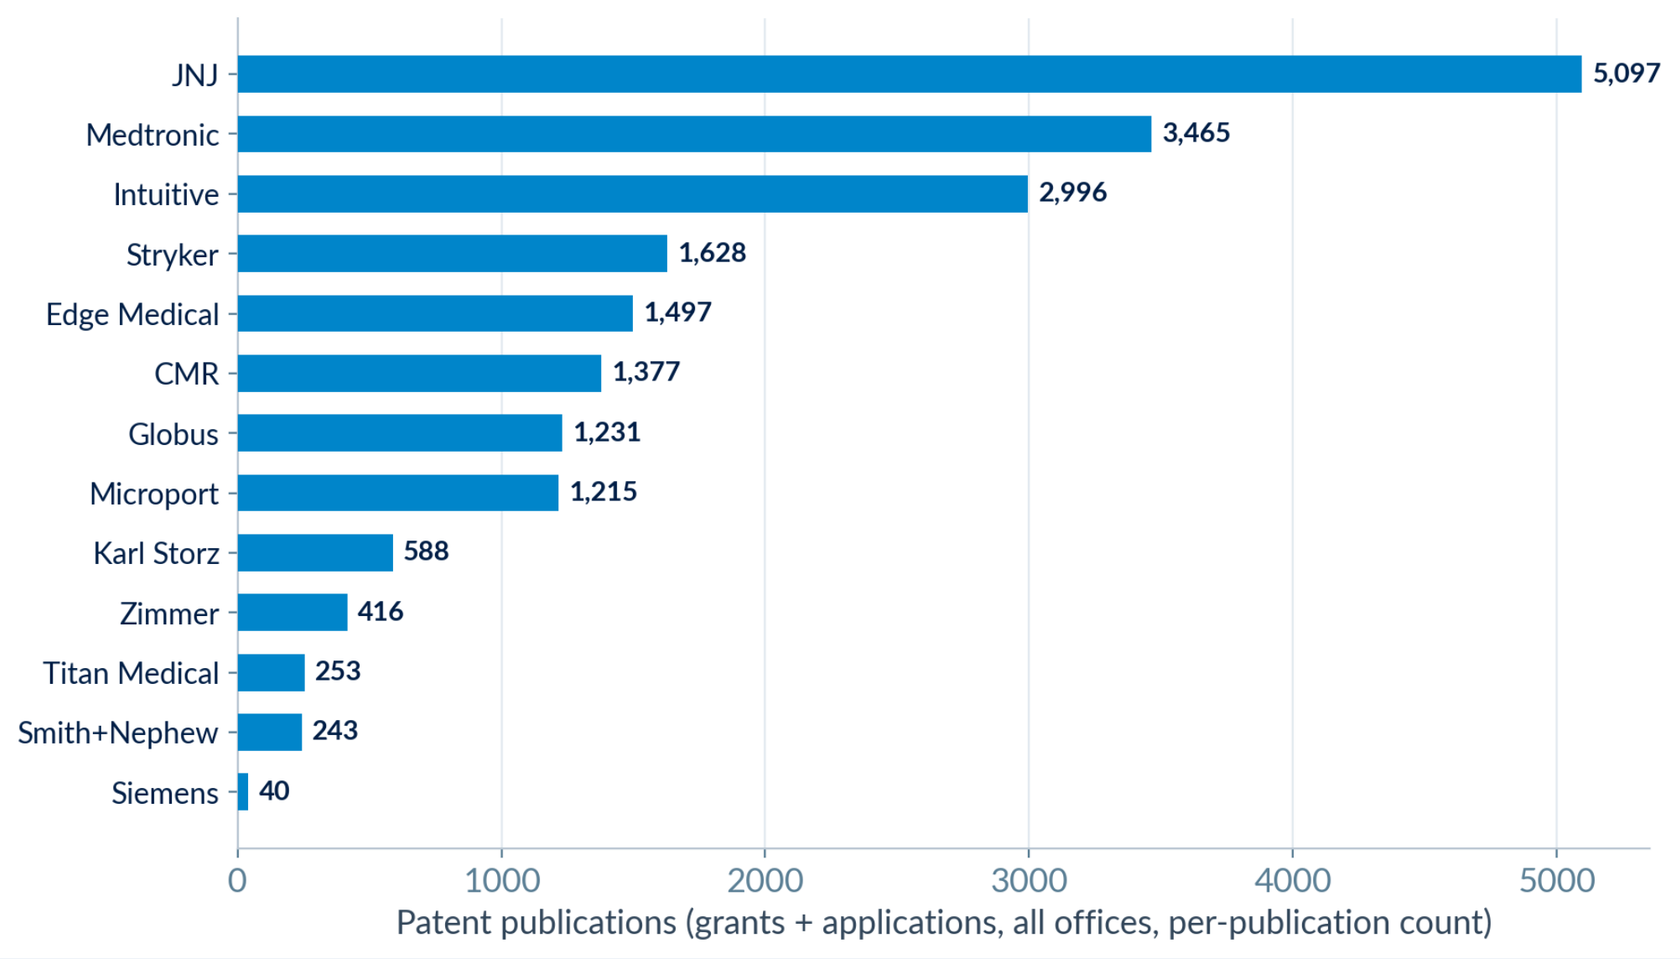

Patent families by holder, subsidiaries stacked separately. Source: Google Patents result counts, TI/AB/CL=(surg* NEAR/3 robot*) per assignee, family-deduplicated; collected 12 Jul 2026

linkedin.com/in/
dmeglan

While there have been many patents published…

Publications (grants + applications, all offices) for the largest holders. Source: Google Patents result counts, per-publication mode; collected 12 Jul 2026

RAW VOLUME

JNJ group (Ethicon + Auris + Verb): 5,097 publications; Intuitive alone: 2,996

Publication counts include every office and every continuation

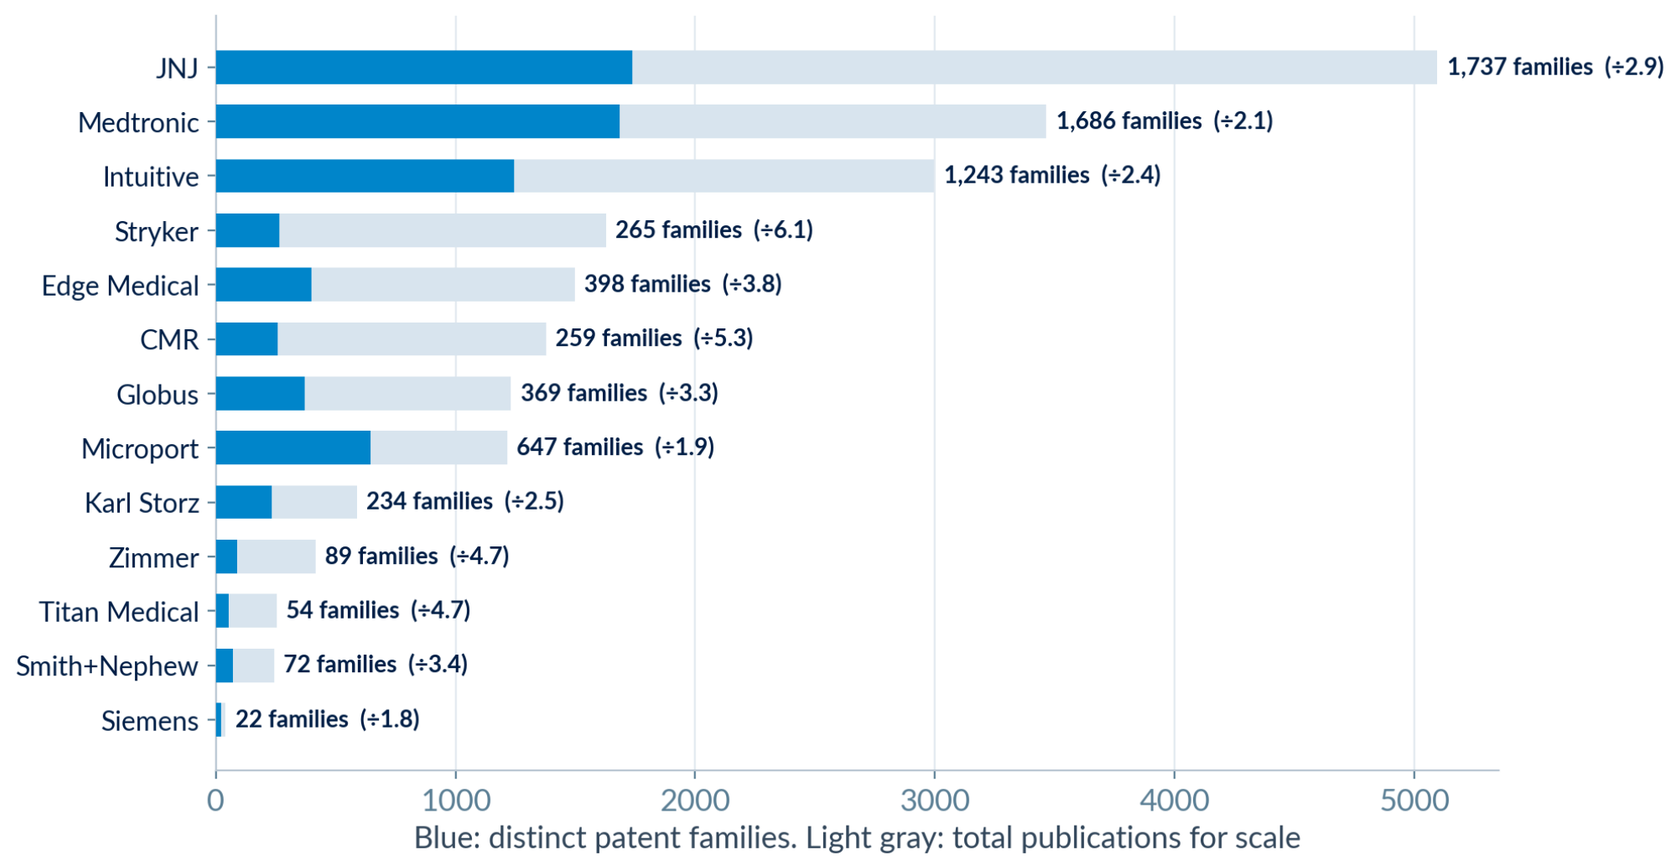

Volume alone overstates novelty, next slide

Source: Google Patents, collected 12 Jul 2026

linkedin.com/in/dmeglan

...many are extensions of existing IP

Distinct patent families vs total publications, same query. Source: Google Patents result counts, family-deduplicated vs per-publication; collected 12 Jul 2026

FAMILY-LEVEL VIEW

Families run about 2x to 6x below publication counts (Stryker 6.1x, CMR 5.3x, Intuitive 2.4x)

JNJ group: 1,737 families across Ethicon, Auris, and Verb

For diligence, count families and claims, not publications

Source: Google Patents, collected 12 Jul 2026

Special Purpose Acquisition Corporations (SPACs)

The SPAC cohort, and how it went: Memic SPAC failed, re-emerged as Momentis; Vicarious delisted Mar 2026, stockholders approved dissolution Jul 2026

Delisted Mar 2026 · stockholders approved dissolution Jul 2026

debut on Wall Street on Monday. The company closed its previously announced business combination with D8 Holdings Corp. last week, gathering $220 million in gross proceeds. The deal, announced this past April, valued the combined company at an enterprise value of approximately $1.1 billion.

memic

breaking surgical boundaries

MOMENTIS
SURGICAL

Israel medical device company **Memic Innovative Surgery Ltd.** today announced the signing of a definitive agreement for a SPAC merger with MedTech Acquisition Corporation (Nasdaq: MTAC). The merged company will have $360 million cash and an equity value of more than $1 billion.

linkedin.com/in/dmeglan

Robots or companies whose status changed in 2026

Exits validate the category; the flameouts show that approval ≠ commercialization

EXITS & WINS

- **TrueHealth / 真健康 → HKEX IPO (Jun 30)**
  +217% day one, ~HK$14.3B cap, ~1,800× oversubscribed, capital is concentrating on the category leader
- **Edge Medical / 精锋 → Hang Seng Composite**
  Index inclusion Jun 8; FY2025 revenue RMB 456M (+185%); overseas installs now exceed domestic
- **Stereotaxis × Robocath**
  Endovascular consolidation (Apr 2026)
- **Ruichu Robotics → HKEX A1 filed (May 27)**
  Pre-revenue lung-puncture robot chasing the TrueHealth window

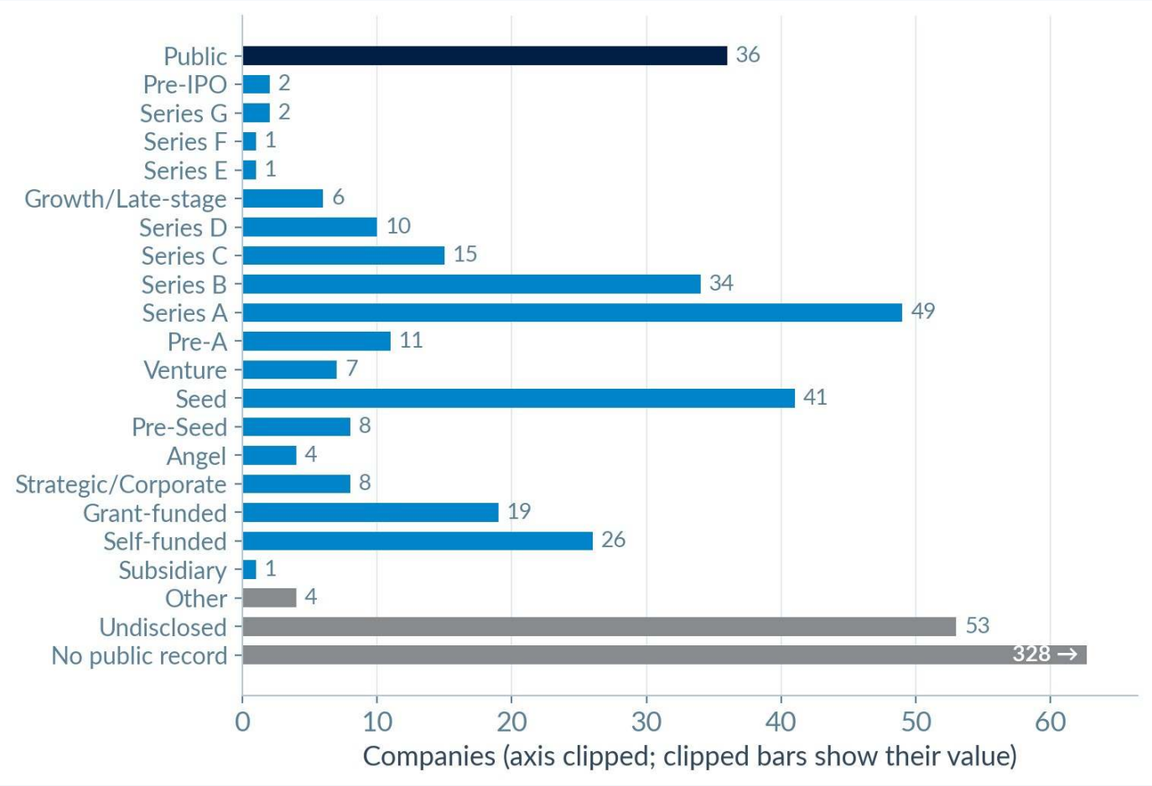

WOUND DOWN / DELISTED

- **Vicarious Surgical (US)**
  NYSE delisting Mar 3 (cap <$15M) → OTC as RBOT; first 2026 Western flameout; stockholders approved dissolution Jul 2026 (liquidation)
- **Asensus / Senhance + Luna (US/DE)**
  Karl Storz discontinues both robots and retires the brand, a ~20-year program ends (strategic wind-down, not bankruptcy)
- **Longhui Medical / 龙慧 (China)**
  NMPA approval Sep 2024 → bankruptcy Jan 2026: approval ≠ commercialization
- **Microya / 微亚 (China)**
  Entire IP + assets auctioned from ~RMB 1.29M starting bid

linkedin.com/in/dmeglan

49% of the field has no public funding story

Funding stage per company (normalized): 666 of 677 companies, dead ones included; the 11 whose stage reads Acquired are in the exits section

328 NO PUBLIC FUNDING RECORD

49% of companies; mostly Chinese patent-only finds, institutes, and quiet SMEs

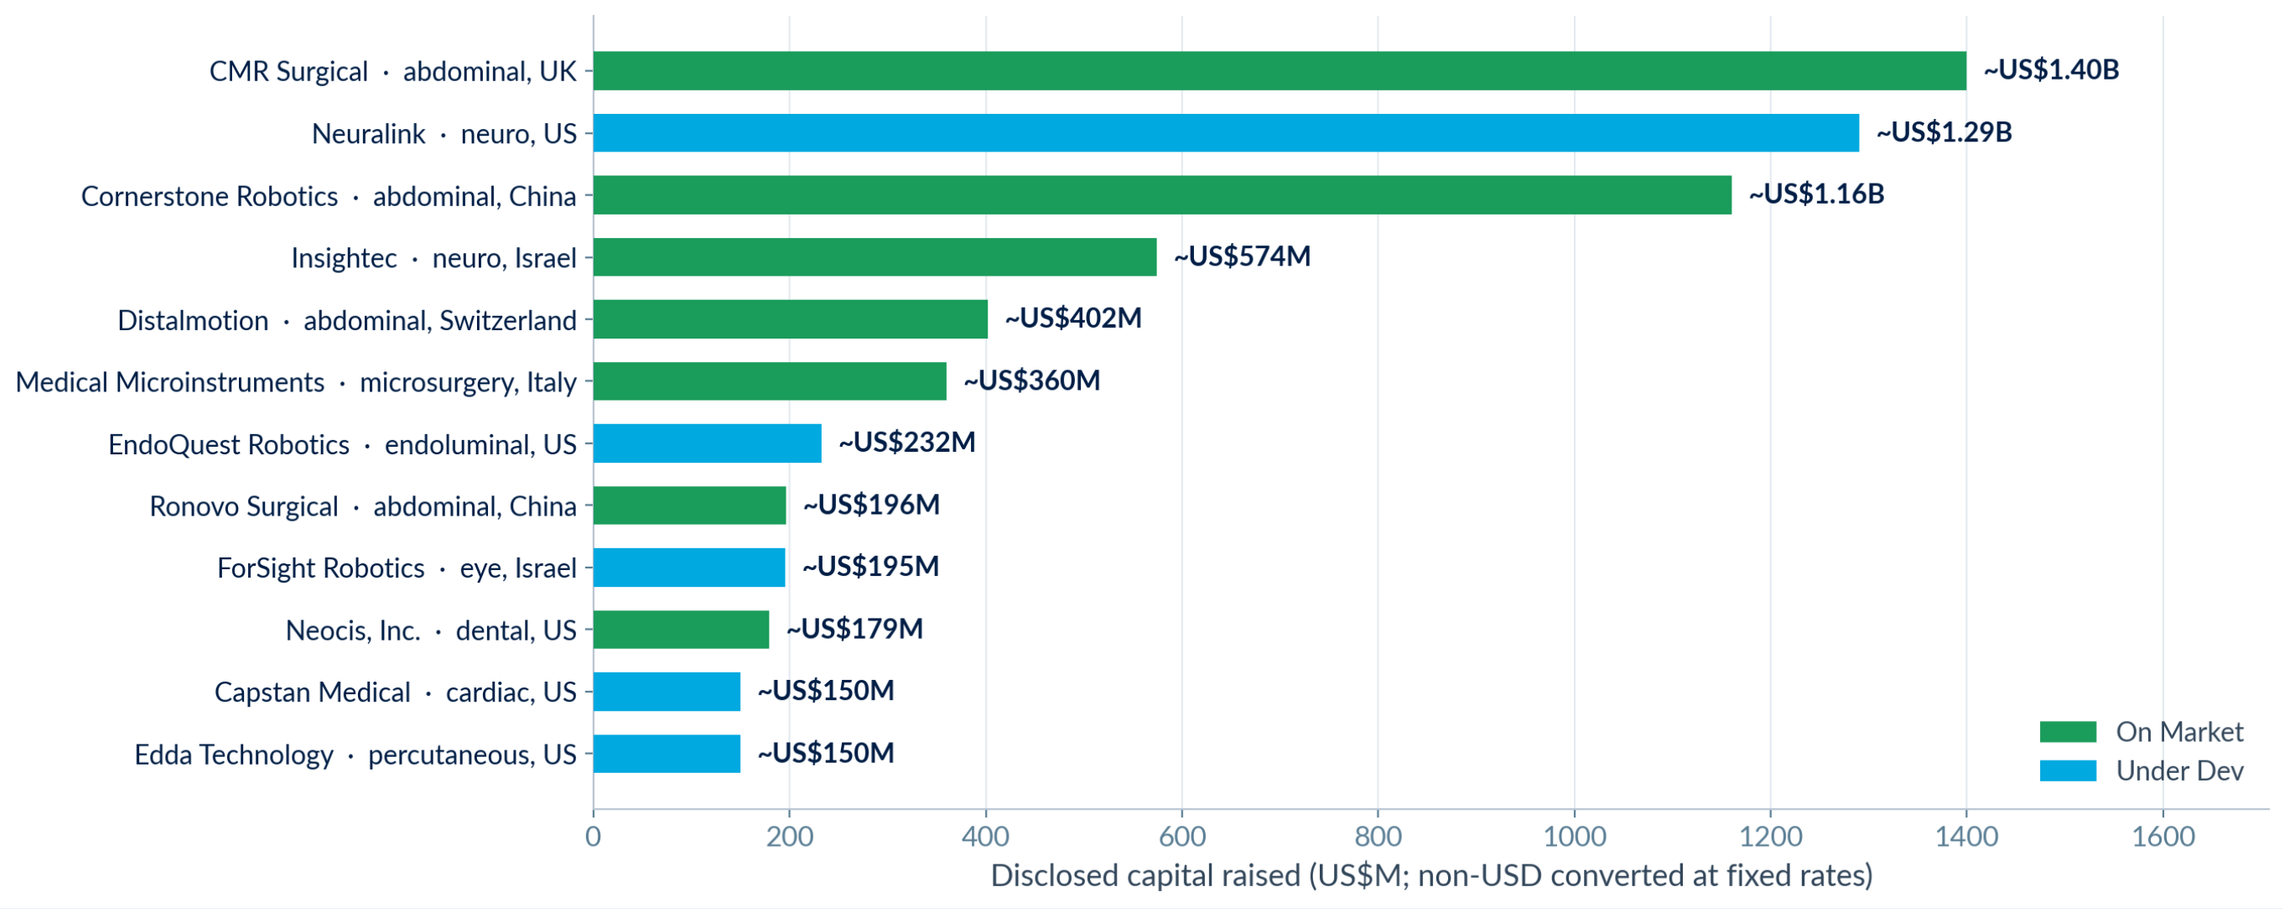

36 public companies bookend the other extreme

164 companies disclose a raise amount; Seed-to-B dominates the private tail

linkedin.com/in/dmeglan

Best-funded private players

Ranked by disclosed capital raised (July 2026), per the master roster

Not shown: self-funded strategics & public leaders, Intuitive, Medtronic (Hugo), J&J (Ottava/Monarch), Stryker (Mako), MicroPort MedBot, Edge Medical (IPO $154M Jan 2026), SS Innovations, PROCEPT. Also MMI ($110M+ Series C) and Edda Technology ($150M strategic at ~$750M valuation).

Major trends

Where the field is stuck, and where it should go next

- **Still too many robots in the same specialties**
  …with similar approaches, and still too many full-platform solutions
- **Control-interface variety is a problem**
  Physical and visual control interfaces differ widely from platform to platform
- **Just roboticizing what is done by hand is not enough**
  First autonomous execution of a procedure phase supports this (Science Robotics, 2025)

GOING FORWARD

Opportunity for existing platform enhancement

- Operate in smaller and/or lower-resourced facilities
- Pay-per-use rather than capital + tool/drape purchases
- Lower capital cost · smaller footprints
- Wear-based rather than number-of-uses-based tool replacement
- Higher-power-density small actuators will change device configurations
- Judicious use of soft actuators as well as live hinges
- Legal frameworks and monetization of telesurgery

Machine learning

Everywhere, expected, penalized if absent; marketing still runs ahead of reality

- **The barrier to entry keeps dropping**
  Technical and data-availability thresholds continue to fall; foundation models increasingly sit beneath specialist data
- **Most applications will be under the hood**
  Optimizing the robot itself; more small, inexpensive sensors coupled with ML/AI video
- **Simulation for training content**
  There is a strong case for simulation in creating training data and content

LEVELING OUTCOMES ACROSS LOCATION & SURGEON

Enhanced surgical-site situational awareness

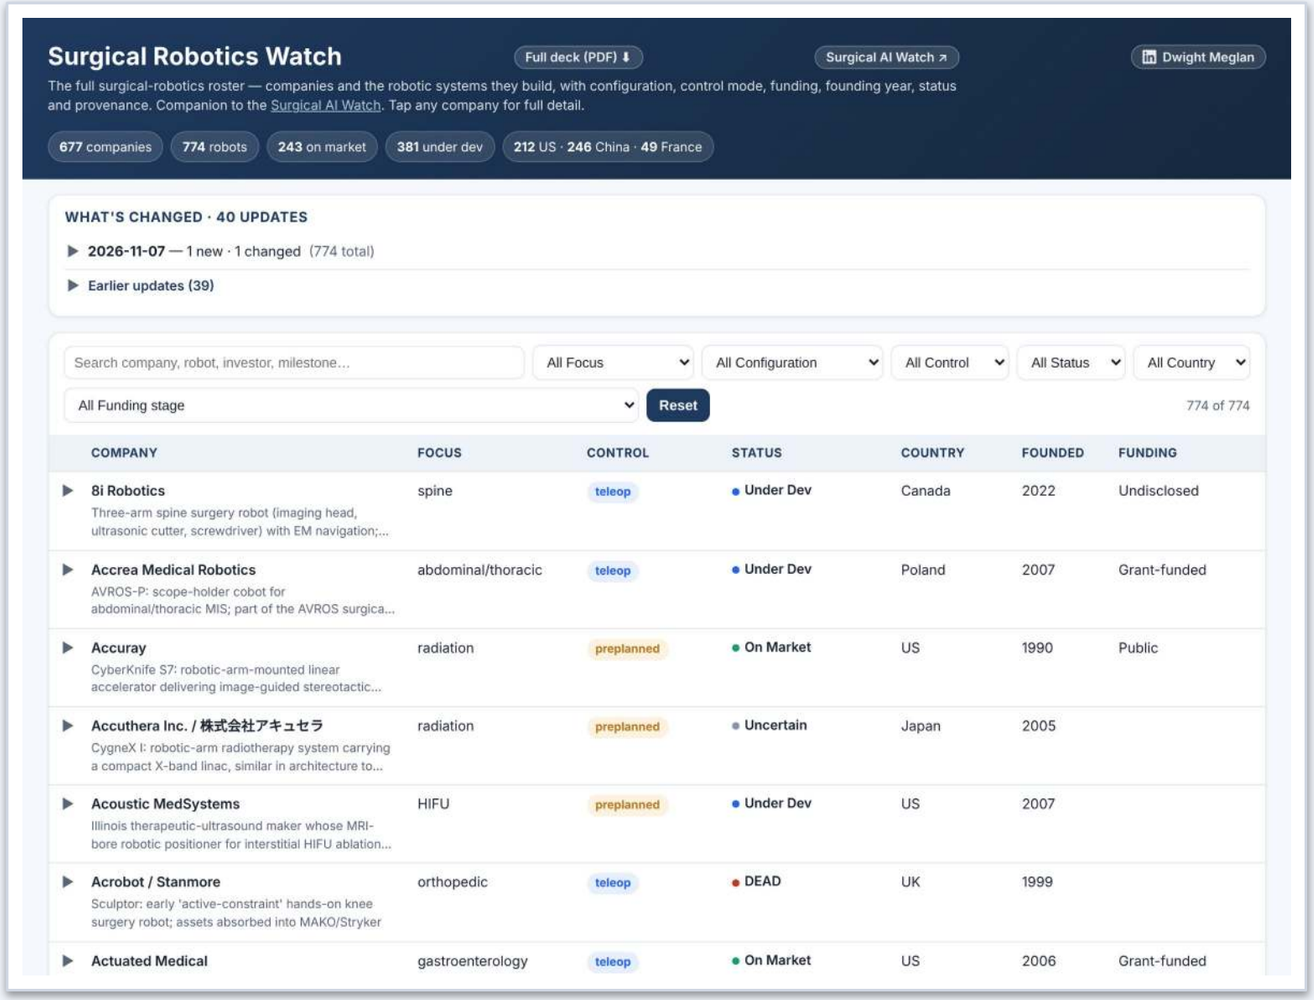

- Contextualization relative to best practices
- Ready availability of ad-hoc mentorship
- Subtask enhancement / automation
- Removing the need for technicians to run things

- Autonomous cholecystectomy phase demonstrated ex vivo, 8/8 (Kim et al., Science Robotics 2025)

Tools like Claude Code are accelerating and broadening use cases, but will need to be thorough in verification: they very quickly make things that look great but have unclear provenance

Surgical Robotics Watch, a live companion dashboard

An updating web version of the data underlying this deck, search, filter, sort, and drill into any company

LIVE AT
dmeglan.github.io/surgical-robot-companies-dashboard

WHAT IT IS

A self-contained, mobile-responsive dashboard generated from the same master spreadsheet behind this deck

WHAT YOU CAN DO

- Full-text search across company, robot, investor, milestone
- Filter by focus area, configuration, control, status, country, funding stage
- Sortable table; tap any company for full detail with milestones and provenance
- STAYS CURRENT

  Rebuilt with every roster refresh (twice-weekly watch); a "what changed" panel accompanies every update
